FortiWeb 6.1.0 CLI Reference

3rd Edition

Change log

03/27/2019	Initial release.

TABLE OF CONTENTS

Introduction

This document describes how to use the command line interface (CLI) of FortiWeb. It assumes that you have already successfully deployed FortiWeb and completed basic setup by following the instructions in the *FortiWeb Administration Guide*: http://docs.fortinet.com/fortiweb/admin-guides.

Scope

At this stage:

- You have administrative access to the web UI and/or CLI.
- The FortiWeb appliance is integrated into your network.
- You have completed firmware updates, if applicable.
- The system time, DNS settings, administrator password, and network interfaces are configured.
- You have set the operation mode.
- You have configured basic logging.
- You have created at least one server policy.
- You have completed at least one phase of auto-learning to jump-start your configuration.

Once that basic installation is complete, you can use this document. This document explains how to use the CLI to:

- Update the FortiWeb appliance.
- Reconfigure features.
- Use advanced features, such as XML protection and reporting.
- Diagnose problems.

This document does **not** cover the web UI or first-time setup. For that information, see the *FortiWeb Administration Guide*: http://docs.fortinet.com/fortiweb/admin-guides.

Conventions

This document uses the conventions described in this section.

IP addresses

To avoid IP conflicts that would occur if you used examples in this document with public IP addresses that belong to a real organization, the IP addresses used in this document are fictional. They belong to the private IP address ranges defined by these RFCs.

RFC 1918: Address Allocation for Private Internets

https://tools.ietf.org/html/rfc1918

RFC 5737: IPv4 Address Blocks Reserved for Documentation

https://tools.ietf.org/html/rfc5737

RFC 3849: IPv6 Address Prefix Reserved for Documentation

https://tools.ietf.org/html/rfc3849

For example, even though a real network's Internet-facing IP address would be routable on the public Internet, in this document's examples, the IP address would be shown as a non-Internet-routable IP such as 192.0.2.108, 198.51.100.155, or 203.0.113.79.

Cautions, notes, & tips

This document uses the following guidance and styles for notes, tips and cautions.

	Warn you about procedures or feature behaviors that could have unexpected or undesirable results including loss of data or damage to equipment.
	Highlight important, possibly unexpected but non-destructive, details about a feature's behavior.
	Present best practices, troubleshooting, performance tips, or alternative methods.

Typographic conventions

Convention	Example
Button, menu, text box, field, or check box label	From **Minimum log level**, select **Notification**.

CLI input	`config system dns`
	`  set primary <address_ipv4>`
	`end`

CLI output	`FortiWeb# diagnose hardware logdisk info`
	`disk number: 1`
	`disk[0] size: 31.46GB`
	`raid level: no raid exists`
	`partition number: 1`
	`mount status: read-write`

Emphasis	HTTP connections are **not** secure and can be intercepted by a third party.
File content	<HTML><HEAD><TITLE>Firewall Authentication</TITLE></HEAD> <BODY><H4>You must authenticate to use this service.</H4>
Hyperlink	https://support.fortinet.com
Keyboard entry	Enter a name for the remote VPN peer or client, such as `Central_Office_1`.
Navigation	Go to **VPN** > **IPSEC** > **Auto Key (IKE)**.
Publication	For details, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides.

Command syntax

The CLI requires that you use valid syntax, and conform to expected input constraints. It will reject invalid commands.

For command syntax conventions such as braces, brackets, and command constraints such as `<address_ipv4>`, see "Notation" on page 49.

What's new

The tables below list commands newly added for FortiWeb 6.1.0.

Command	Change
`config system interface` (page 281)	

`config system interface`
`edit "<interface_name>"`
`set vlanproto {8021q | 8021ad}`
`end`
	New.
	Use this command to configure vlans 802.1Q and 802.1ad.

`config system ha` (page 261)	

`config system network-option`
`set server-policy-hlck {enable | disable}`
`end`
	New.
	Enable to check the server policy health.
	Server policy health check is only available if the operation mode is Reverse Proxy, and the HA mode is Active-Active.

`config system network-option` (page 289)	

`config system network-option`
`set tcp-mtu-probing {enable | disable}`
`set dns-cache-timeout <dns-cache-timeout_int>`
`end`
	New.
	Configure how long the DNS proxy cache expires. The valid range is 0~60 (minutes). Only integers are supported.
	Enable to negotiate with the upstream and downstream switches to get the maximum MTU value. Adjust the MTU accordingly for actual need.

`config system feature-visibility` (page 242)	

`config system feature-visibility`
`set traffic-mirror {enable | disable}`
`end`
	New.
	Enable to display traffic mirror rule, profile, and policy configuration options.

`config user tacacs+ user` (page 331)	

`config user tacacs+-user`
`edit "<tacacs+-user_name>"`
`set server {radius_ipv4 | domain name}`
`set secret "<password_str>"`
`set auth-type {auto | ms_chap | chap | pap | ascii}`
`next`
`end`
	New.
	Use this command to configure TACACS+ queries that can be used for authentication of administrators' access to the web UI or CLI.

Command	Change
`config server-policy setting` (page 186)	

`config server-policy setting`
`set server-pool-connection-limit-log {enable | disable}`
`end`
	New.
	Enable to send a warning level event log when the connection number of each real server reaches the limitation.

`config waf signature_update_policy` (page 481)	

`config waf signature_update_policy`
`set status {enable | disable}`
`end`
	New.
	Enable to list new signatures from the FDS update.

`config waf staged_signature_list` (page 497)	

`config waf staged_signature_list`
`edit "<wvs-policy_name>"`
`set status {unapplied | applied | disabled}`
`end`
	New.
	Use this command to update the status of the signatures.

`config wvs policy` (page 563)	

`config wvs policy`
`edit signature_id <signature_id_int>`
`set report_format {html | pdf | xml}`
`end`
	New.
	Add the supported report format xml.

`config waf custom-access rule` (page 368)	

`config geo-filter`
`edit <entry_index>`
`set match-exclusive {yes | no}`
`set country-list <country-list_str>`
`end`
`config http-header-filter`
`edit <entry_index>`
`set cus-header-name-type {plain | regular}`
`end`
	New.
	Add Geo IP filter to match the traffic from specified countries.
	Indicate whether `What's new` (page 34)is a literal header name (`plain`) or a regular expression that indicates multiple possible valid header names (`regular`).

`config waf site-publish-helper rule` (page 485)	

`config waf site-publish-helper rule`
`edit "<site-publish-rule_name>"`
`set cookieless {enable | disable}`
`set append-custom-header {enable | disable}`
	New.

Command	Change
set custom-header-name <custom-header-name_str> set custom-header-value-format <custom-header-value-format_str> set pass-failed-auth {enable | disable} set cache-tgs-ticket {enable | disable} end	
config server-policy http-content-routing-policy (page 119)	
config server-policy http-content-routing-id edit "<routing-policy_name>" set server-pool "<server-pool_name>" config content-routing-match-list edit <entry_index> set match-object {http-host | http-request | url-parameter | http-referer | http-cookie | http-header | source-ip | x509-certificate-Subject | x509-certificate-Extension | https-sni | geo-ip} set country-list <country-list_str> next end next end	New.
config server-policy server-pool (page 161)	
config server-policy server-pool edit <server-pool_name> config pserver-list edit <entry_index> set adfs-domain <adfs-domain_str> set adfs-username <adfs-username_str> set adfs-password <adfs-password_str> set multi-certificate {enable | disable} set certificate-group <certificate-group_str> next end next end	New. Add AD FS and multi-certificate related settings.
config server-policy policy (page 136)	

Command	Change

`config server-policy policy`
`edit <policy_name>`
`set protocol {HTTP | FTP {HTTP | FTP | ADFSPIP}`
`set traffic-mirror {enable | disable}`
`set traffic-mirror-type {client-side | server-side| both-side}`
`set traffic-mirror-profile <traffic-mirror-profile_str>`
`set adfs-certificate-ssl-client-verify <adfs-certificate-ssl-client-verify_str>}`
`set adfs-certificate-service <adfs-certificate-service_str>}`
`set multi-certificate {enable | disable}`
`set certificate-group <certificate-group_str>}`
`next`
`end`
`next`
`end`
	New.
	Add AD FS, traffic mirror, and multi-certificate related settings

`config server policy traffic-mirror` (page 187)	

`config server-policy traffic-mirror`
`edit "<traffic-mirror_name>"`
`config mirror-rule`
`edit mirror-rule <mirror-rule_str>`
`set mode {direct | switch | server}`
`set interface <interface_int>`
`set destination-mac <destination-mac_str>`
`set server-ip <server-ip_str>`
`set server-port <server-port_int>`
`next`
`end`
`next`
`end`
	New.
	Use this command to configure FortiWeb to send traffic to third party IPS/IDS devices through network interfaces for traffic monitoring in Reverse Proxy and True Transparent Proxy modes.

`config system certificate sni` (page 226)	

`config system certificate sni`
`edit <sni_name>`
`config members`
`edit <entry_index>`
`set multi-local-cert {enable | disable}`
`set multi-local-cert-group <multi-local-cert-group_name>`
`end`
`next`
`end`
	New.
	Use this command to configure multi local certificate settings.

Command	Change
`config system certificate offline-sni` (page 223)	

`config system certificate offline-sni`
`edit "<offline-sni_name>"`
`config members`
`edit <entry_index>`
`set domain-type {plain | regular}`
`set domain "<server_fqdn>"`
`set local-cert "<local-cert_name>"`
`end`
`next`
`end`
	New.
	Use this command to configure offline SNI.

`config system certificate multi-local` (page 222)	

`config system certificate multi-local`
`edit "<certificate-multi-local_name>"`
`set comment "<comment_str>"`
`set rsa-cert <rsa-cert_str>`
`set dsa-cert <dsa-cert_str>`
`set ecc-cert <ecc-cert_str>`
`next`
`end`
	New.
	Use this command to multi local certificate settings.

`config wvs profile` (page 565)	

`config wvs profile`
`edit "<wvs_profile_name>"`
`set scan-target <scan-target_str>`
`set scan-template <scan-template_id>`
`set request-timeout <request-timeout_int>`
`set ignore-session-cookies {enable | disable}`
`set user-agent-type {custom | random}`
`set custom-user-agent <custom-user-agent_str>`
`set custom-header0 <custom-header0_str>`
`set custom-header1 <custom-header1_str>`
`set custom-header2 <custom-header2_str>`
`set custom-header3 <custom-header3_str>`
`set custom-header4 <custom-header4_str>`
`set custom-header5 <custom-header5_str>`
`set custom-header6 <custom-header6_str>`
	New.
	Use this command to configure vulnerability scan profiles.

Command	Change
set custom-header7 <custom-header7_str> set custom-header8 <custom-header8_str> set custom-header9 <custom-header9_str> set sub-path-limit <sub-path-limit_int> set max-scan-time <max-scan-time_int> set max-crawl-time <max-crawl-time_int> set max-params-limit <max-params-limit_int> set max-file-size <max-file-size_int> set max-http-retries <max-http-retries_int> set specify-urls-for-scanning {enable | disable} set follow-regex <follow-regex_int> set ignore-regex <ignore-regex_int> set http-basic-authentication <http-basic-authentication_int> set basic-username <basic-username_str> set basic-password <basic-password_str> set form-based-authentication {enable | disable} set form-based-username <form-based-username_str> set form-based-password <form-based-password_str> set form-based-auth-url <form-based-auth-url_str> set username-field <username-field_str> set password-field <password-field_str> set cookie-jar-file <cookie-jar-file_str> set session-check-url <session-check-url_str> set session-check-str <session-check-url_str> set data-format <data-format_str> end	
config wvs template (page 571)	
config wvs template edit "<wvs_template_name>"	New. Use this command to pre-define the scan profile.

Command	Change
`set template {audit | bruteforce | crawl | grep | infrastructure}` `end`	
`config wvs limit` (page 562)	

`config wvs limit`
`set report-path-size <report-path-size_int>`
`set request-interval <request-interval_int>`
`set scan-cpu-usage <scan-cpu-usage_int>`
`set scan-memory-usage <scan-memory-usage_int>`
`set single-report-size <single-report-size_int>`
`set verbose-output {enable | disable}`
`end`
	New.
	Use this command to limit scanning related settings, such as the scanning report size, request interval, etc.

`config system ha-mgmt-router-policy` (page 277)	

`config system ha-mgmt-router-policy`
`edit <policy_index>`
`set iif <incoming_interface_name>`
`set src <source_ip>`
`set dst <destination_ip>`
`set oif <outgoing_interface_name>`
`set gateway <router_ip>`
`set priority <priorty_int>`
`next`
`end`
	New.
	Use this command to configure policy route for the HA cluster member.

`config system ha-mgmt-router-static` (page 276)	

`config system ha-mgmt-router-static`
`edit <route_index>`
`set device <interface_name>`
`set dst <destination_ip>`
`set gateway <router_ip>`
`next`
`end`
	New.
	Use this command to configure static route for the HA cluster member.

`config system ha-aa-server-policy-hlck` (page 273)	

`config system ha-aa-server-policy-hlck`
`edit "<health-check_id>"`
`set HTTPS {enable | disable}`
`set client-cert <client-certificate-name>`
`set relationship {and | or}`
`configure health-list`
	New.
	Use this command to configure server policy health check for HA cluster member.

Command	Change

<pre>edit <entry_index>
set time-out <seconds_int>
set retry-times <retries_int>
set interval <seconds_int>
set url-path "<request_str>"
set method {get | head | post}
set match-type {response-code |
match-content | all}
set response-code {response-code_
int}
set match-content "<match-
content_str>"
next
end
next
end</pre>	

config system manager-mode (page 288)	

<pre>config system manager
set mode {server | client |
standalone}
set server-type {physical}
set server-ip <server_ip_address>
set server-port <integer>
set config-sync-port <integer>
set connection-interval <integer>
set connection-lost-threshold
<integer>
set callback-url <string>
set server-public-ip <server_public_
ip_address>
next
end</pre>
	New.
	Use this command to configure manage mode for the auto-scaling cluster.

config waf bot-detection-policy (page 347)	

<pre>config waf bot-detection-policy
edit <bot-detection-policy_ID>
set policy-id <server-policy-id>
set model-status {enable | disable}
set advanced-mode {enable | disable}
set client-identification-method {IP |
IP-and-User-Agent | Cookie}
set sampling-count <integer>
set sampling-count-per-client
<integer>
set sampling-time-per-vector <integer>
set training-accuracy <percentage>
set cross-validation <percentage>
set testing-accuracy <percentage>
set selected-model {Strict | Loose}
set anomaly-count <integer></pre>
	New.
	Use this command to configure AI-based bot detection.

Command	Change

```
            set bot-confirmation {enable |
                disable}
            set verification-method {Real-Browser-
                Enforement | Captcha-Enforcement}
            set validation-timeout <integer>
            set max-attempt-times <integer>
            set auto-refresh {enable | disable}
            set refresh-factor <value-from-0-to-
                one>
            set minimum-vector-number <integer>
            set action {alert | deny_no_log |
                alert_deny | block-period}
            set block-period <integer>
            set severity {High | Medium | Low |
                Info}
            set trigger <trigger_policy_name>
            config allow-source-ip
               edit <allow-source-ip-list-id>
                  set ip <ip-address>
               next
            end
            config bot-detection-exception-list
               edit <bot-detection-exception-list-
                   id>
                  set host <string>
                  set host-status {enable |
                      disable}
                  set url-type {plain | regular}
                  set url-pattern <string>
               next
            end
         next
      end
```

Using the CLI

The command line interface (CLI) is an alternative to the web UI.

You can use either interface or both to configure the FortiWeb appliance. In the web UI, you use buttons, icons, and forms. In the CLI, you either type text commands or upload batches of commands from a text file, like a configuration script.

If you are new to FortiWeb, or if you are new to the CLI, this section can help you to become familiar with using it.

Connecting to the CLI

You can access the CLI in two ways:

- **Locally**—Connect your computer, terminal server, or console directly to the FortiWeb appliance's console port.
- **Through the network**—Connect your computer through any network attached to one of the FortiWeb appliance's network ports. To connect using a Secure Shell (SSH) or Telnet client, enable the network interface for Telnet or SSH administrative access. Enable HTTP/HTTPS administrative access to connect using the **CLI Console** widget in the web UI.

Local access is required in some cases, including when you're:

- Installing FortiWeb for the first time and it's not yet configured to connect to your network, unless you reconfigure your computer's network settings for a peer connection, you may only be able to connect to the CLI using a local console connection. For details, see the *FortiWeb Administration Guide*:

  http://docs.fortinet.com/fortiweb/admin-guides

- Restoring the firmware and FortiWeb utilizes a boot interrupt. Network access to the CLI is not available until **after** the boot process completes, and therefore local CLI access is the only viable option.

Before you can access the CLI through the network, you must enable SSH, HTTP/HTTPS, and/or Telnet on the network interface through which you will access the CLI.

Connecting to the CLI using a local console

Local console connections to the CLI are formed by directly connecting your management computer or console to the FortiWeb appliance, using its DB-9 console port.

Requirements

- A computer with an available serial communications (COM) port
- The RJ-45-to-DB-9 or null modem cable included in your FortiWeb package
- Terminal emulation software such as PuTTY (http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html)

The following instructions describe connecting to the CLI using PuTTY; steps may vary with other terminal emulators.

To connect to the CLI using a local console connection

1. Using the null modem or RJ-45-to-DB-9 cable, connect the FortiWeb appliance's console port to the serial communications (COM) port on your management computer.
2. On your management computer, start PuTTY.
3. In the **Category** tree on the left, go to **Connection > Serial** and configure these settings:

Serial line to connect to	COM1 (or, if your computer has multiple serial ports, the name of the connected serial port)
Speed (baud)	9600
Data bits	8
Stop bits	1
Parity	None
Flow control	None

4. In the **Category** tree on the left, go to **Session** (**not** the sub-node, **Logging**).
5. From **Connection type**, select **Serial**.
6. Click **Open**.
7. Press the Enter key to initiate a connection.
8. Enter a valid administrator account name (such as `admin`) then press Enter.
9. Enter the password for that administrator account and press Enter. By default, there is no password for the `admin` account.

   The CLI displays the following text, followed by a command line prompt:

   ```
   Welcome!
   ```

   You can now enter CLI commands, and configure access to the CLI through SSH or Telnet. For details, see "Enabling access to the CLI through the network (SSH or Telnet or CLI Console widget)" on page 44.

Enabling access to the CLI through the network (SSH or Telnet or CLI Console widget)

SSH, Telnet, or **CLI Console** widget (via the web UI) access to the CLI requires connecting your computer to the FortiWeb appliance using one of its RJ-45 network ports. You can either connect directly, using a peer connection between the two, or through any intermediary network.

If you do not want to use an SSH/Telnet client and you have access to the web UI, you can alternatively access the CLI through the network using the **CLI Console** widget in the web UI. For details, see the *FortiWeb Administration Guide*:

http://docs.fortinet.com/fortiweb/admin-guides

You must enable SSH and/or Telnet on the network interface associated with that physical network port. If your computer is **not** connected directly or through a switch, you must also configure the FortiWeb appliance with a static route to a router that can forward packets from the FortiWeb appliance to your computer. For details, see "router static" on page 110.

You can do this using either:

- A local console connection (see the following procedure)
- The web UI (see the *FortiWeb Administration Guide*; http://docs.fortinet.com/fortiweb/admin-guides)

Requirements

- A computer with an available serial communications (COM) port and RJ-45 port
- Terminal emulation software such as PuTTY (http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html)
- The RJ-45-to-DB-9 or null modem cable included in your FortiWeb package
- A crossover Ethernet cable (if connecting directly) or straight-through Ethernet cable (if connecting through a switch or router)
- Prior configuration of the operating mode, network interface, and static route

To enable SSH or Telnet access to the CLI using a local console connection

1. Using the network cable, connect the FortiWeb appliance's network port either directly to your computer's network port, or to a network through which your computer can reach the FortiWeb appliance.
2. Note the number of the physical network port.
3. Using a local console connection, connect and log into the CLI. For details, see "Connecting to the CLI using a local console" on page 43.
4. Enter the following commands:

```
config system interface
   edit <interface_name>
      set allowaccess {http https ping snmp ssh telnet}
end
```

where:

- `<interface_name>` is the name of the network interface associated with the physical network port, such as `port1`
- `{http https ping snmp ssh telnet}` is the complete, space-delimited list of permitted administrative access protocols, such as `https ssh telnet`; omit protocols that you do not want to permit

For example, to exclude HTTP, SNMP, and Telnet, and allow only HTTPS, ICMP ECHO (ping), and SSH administrative access on `port1`:

```
config system interface
   edit "port1"
      set allowaccess ping https ssh
   next
end
```

Telnet is not a secure access method. SSH should be used to access the CLI from the Internet or any other untrusted network.

5. To confirm the configuration, enter the command to view the access settings for the interface.

   ```
   show system interface <interface_name>
   ```

   The CLI displays the settings, including the management access settings, for the interface.

6. If you will be connecting indirectly, through one or more routers or firewalls, configure the appliance with at least one static route so that replies from the CLI can reach your client. See "router static" on page 110.

   To connect to the CLI through the network interface, see "Connecting to the CLI using SSH" on page 46 or "Connecting to the CLI using Telnet" on page 47.

Connecting to the CLI using SSH

Once you configure the FortiWeb appliance to accept SSH connections, you can use an SSH client on your management computer to connect to the CLI.

Secure Shell (SSH) provides both secure authentication and secure communications to the CLI. Supported SSH protocol versions, ciphers, and bit strengths vary by whether or not you have enabled FIPS-CC mode or are using a low encryption (LENC) version, but generally include SSH version 2 with AES-128, 3DES, Blowfish, and SHA-1.

Requirements

- A computer with an RJ-45 Ethernet port
- a crossover Ethernet cable
- a FortiWeb network interface configured to accept SSH connections (see "Enabling access to the CLI through the network (SSH or Telnet or CLI Console widget)" on page 44)
- an SSH client such as PuTTY (http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html)

The following procedure describes connection using PuTTY software; steps may vary with other terminal emulators.

To connect to the CLI using SSH

1. On your management computer, start PuTTY.

   Initially, the **Session** category of settings is displayed.

2. In **Host Name (or IP Address)**, enter the IP address of a network interface on which you have enabled SSH administrative access.

3. In **Port**, enter `22`.

4. For **Connection type**, select **SSH**.

5. Click **Open**.

   The SSH client connects to the FortiWeb appliance.

   The SSH client may display a warning if this is the first time you are connecting to the FortiWeb appliance and its SSH key is not yet recognized by your SSH client, or if you have previously connected to the FortiWeb appliance but it used a different IP address or SSH key. If your management computer is directly connected to the FortiWeb appliance with no network hosts between them, this is normal.

6. Click **Yes** to verify the fingerprint and accept the FortiWeb appliance's SSH key. You will not be able to log in until you have accepted the key.
7. Enter a valid administrator account name (such as `admin`) and press Enter.

   Alternatively, you can log in using an SSH key. For details, see "system admin" on page 193.
8. Enter the password for this administrator account and press Enter.

If three incorrect login or password attempts occur in a row, you will be disconnected. Wait one minute, then reconnect to attempt the login again.

The FortiWeb appliance displays a command prompt—its host name followed by a `#`. You can now enter CLI commands.

Connecting to the CLI using Telnet

Once the FortiWeb appliance is configured to accept Telnet connections, you can use a Telnet client on your management computer to connect to the CLI.

Telnet is not a secure access method. SSH should be used to access the CLI from the Internet or any other untrusted network.

Requirements

- A computer with an RJ-45 Ethernet port
- A crossover Ethernet cable
- A FortiWeb network interface configured to accept Telnet connections (see "Enabling access to the CLI through the network (SSH or Telnet or CLI Console widget)" on page 44)
- Terminal emulation software such as PuTTY (http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html)

The following procedure describes connection using PuTTY software; steps may vary with other terminal emulators.

To connect to the CLI using Telnet

1. On your management computer, start PuTTY.
2. In **Host Name (or IP Address)**, type the IP address of a network interface on which you have enabled Telnet administrative access.
3. In **Port**, enter `23`.
4. For **Connection type**, select **Telnet**.
5. Click **Open**.
6. Type a valid administrator account name (such as `admin`) and press Enter.
7. Type the password for this administrator account and press Enter.

The FortiWeb appliance displays a command prompt—its host name followed by a `#`. You can now enter CLI commands.

If three incorrect login or password attempts occur in a row, you will be disconnected. Wait one minute, then reconnect to attempt the login again.

Command syntax

When entering a command, the CLI requires that you use valid syntax and conform to expected input constraints. It will reject invalid commands.

For example, if you do not type the entire object that will receive the action of a command operator such as `config`, the CLI will return an error message such as:

```
Command fail. CLI parsing error
```

This document uses the following conventions to describe valid command syntax.

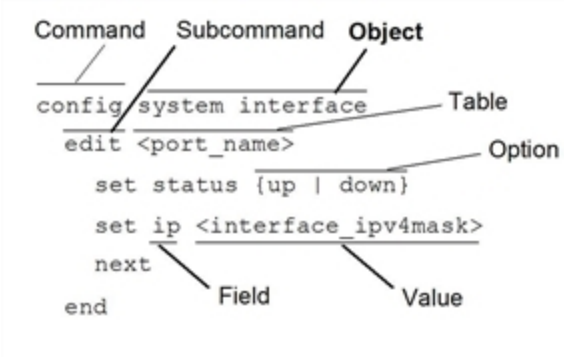
Terminology

Each command line consists of a command word followed by words for the configuration data or other specific item that the command uses or affects, for example:

```
get system admin
```

This document uses the below terms to describe the function of each word in the command line.

Command syntax terminology



- **Command**—A word that begins the command line and indicates an action that FortiWeb should perform on a part of the configuration or host on the network, such as `config` or `execute`. Together with other words, such as fields or values, that you terminate by pressing the Enter key, it forms a command line. Exceptions include multi-line command lines, which can be entered using an escape sequence. For details, see "Shortcuts & key commands" on page 58.

  Valid command lines must be unambiguous if abbreviated. For details, see "Command abbreviation" on page 59.

  Optional words or other command line permutations are indicated by syntax notation. For details, see "Notation" on page 49.

If you do not enter a known command, the CLI will return an error message such as:

```
Unknown action 0
```

- **Subcommand**—A kind of command that is available only when nested within the scope of another command. After entering a command, its applicable subcommands are available to you until you exit the scope of the command, or until you descend an additional level into another subcommand. Indentation is used to indicate levels of nested commands. For details, see "Indentation" on page 49.

  Not all top-level commands have subcommands. Available subcommands vary by their containing scope. For details, see "Subcommands" on page 52.

- **Object**—A part of the configuration that contains tables and/or fields. Valid command lines must be specific enough to indicate an individual object.
- **Table**—A set of fields that is one of possibly multiple similar sets that each have a name or number, such as an administrator account, policy, or network interface. These named or numbered sets are sometimes referenced by other parts of the configuration that use them. For details, see "Notation" on page 49.
- **Field**—The name of a setting, such as `ip` or `hostname`. Fields in some tables must be configured with values. Failure to configure a required field will result in an invalid object configuration error message, and the FortiWeb appliance will discard the invalid table.
- **Value**—A number, letter, IP address, or other type of input that is usually the configuration setting held by a field. Some commands, however, require multiple input values which may not be named but are simply entered in sequential order in the same command line. Valid input types are indicated by constraint notation. For details, see "Notation" on page 49.
- **Option**—A kind of value that must be one or more words from a fixed set of options. For details, see "Notation" on page 49.

Indentation

Indentation indicates levels of nested commands, which indicate what other subcommands are available from within the scope.

For example, the `edit` subcommand is available only within a command that affects tables, and the `next` subcommand is available only from within the `edit` subcommand:

```
config system interface
   edit port1
      set status up
   next
end
```

For details about available subcommands, see "Subcommands" on page 52.

Notation

Brackets, braces, and pipes are used to denote valid permutations of the syntax. Constraint notations, such as `<address_ipv4>`, indicate which data types or string patterns are acceptable value input.

If you do not use the expected data type, the CLI returns an error message such as:

```
object set operator error, -4003 discard the setting
The request URL must start with "/" and without domain name.
```

or:

```
invalid unsigned integer value :-:

value parse error before '-'
Input value is invalid.
```

and may either **reject** or **discard** your settings instead of saving them when you type `end`.

Command syntax notation

Square brackets [ ]

A non-required (optional) word or words. For example:

```
[verbose {1 | 2 | 3}]
```

indicates that you may either omit or type both the `verbose` word and its accompanying option, such as:

```
verbose 3
```

Curly braces { }

A word or series of words that is constrained to a set of options delimited by either vertical bars or spaces.

You must enter at least one of the options, unless the set of options is surrounded by square brackets [ ].

Options delimited by vertical bars |

Mutually exclusive options. For example:

```
{enable | disable}
```

indicates that you must enter either `enable` or `disable`, but must not enter both.

Options delimited by spaces

Non-mutually exclusive options. For example:

```
{http https ping snmp ssh telnet}
```

indicates that you may enter all or a subset of those options, in any order, in a space-delimited list, such as:

```
ping https ssh
```

Note: To change the options, you must re-type the entire list. For example, to add `snmp` to the previous example, you would type:

```
ping https snmp ssh
```

If the option adds to or subtracts from the existing list of options, instead of

	replacing it, or if the list is comma-delimited, the exception will be noted.
Angle brackets < >	A word constrained by data type. To define acceptable input, the angled brackets contain a descriptive name followed by an underscore (_) and suffix that indicates the valid data type. For example: `<retries_int>` indicates that you should enter a number of retries, such as `5`. Data types include: • `<xxx_name>`—A name referring to another part of the configuration, such as `policy_A`. • `<xxx_index>`—An index number referring to another part of the configuration, such as `0` for the first static route. • `<xxx_pattern>`—A regular expression or word with wild cards that matches possible variations, such as `*@example.com` to match all e-mail addresses ending in `@example.com`. • `<xxx_fqdn>`—A fully qualified domain name (FQDN), such as `mail.example.com`. • `<xxx_email>`—An email address, such as `admin@mail.example.com`. • `<xxx_url>`—A uniform resource locator (URL) and its associated protocol and host name prefix, which together form a uniform resource identifier (URI), such as `http://www.fortinet.com/`. • `<xxx_ipv4>`—An IPv4 address, such as `192.0.2.99`. • `<xxx_v4mask>`—A dotted decimal IPv4 netmask, such as `255.255.255.0`. • `<xxx_ipv4mask>`—A dotted decimal IPv4 address and netmask separated by a space, such as `192.0.2.99 255.255.255.0`. • `<xxx_ipv4/mask>` — A dotted decimal IPv4 address and CIDR-notation netmask separated by a slash, such as such as `192.0.2.99/24`. • `<xxx_ipv6>`—A colon(:)-delimited hexadecimal IPv6 address, such as `3f2e:6a8b:78a3:0d82:1725:6a2f:0370:6234`. • `<xxx_v6mask>`—An IPv6 netmask, such as `/96`. • `<xxx_ipv6mask>`—An IPv6 address and netmask separated by a space. • `<xxx_str>`—A string of characters that is **not** another data type, such as `P@ssw0rd`. Strings containing spaces or special characters must be

surrounded in quotes or use escape sequences. For details, see "Special characters" on page 59.

- `<xxx_int>`—An integer number that is **not** another data type, such as `15` for the number of minutes.

Subcommands

Once you connect to the CLI, you can enter commands.

Each command line consists of a command word that is usually followed by words for the configuration data or other specific item that the command uses or affects, for example:

```
get system admin
```

Subcommands are available from within the scope of some commands. When you enter a subcommand level, the command prompt changes to indicate the name of the current command scope. For example, after entering:

```
config system admin
```

the command prompt becomes:

```
(admin)#
```

Applicable subcommands are available to you until you exit the scope of the command, or until you descend an additional level into another subcommand.

For example, the `edit` subcommand is available only within a command that affects tables; the `next` subcommand is available only from within the `edit` subcommand:

```
config system interface
   edit port1
      set status up
   next
end
```

Available subcommands vary by command. From a command prompt within `config`, two types of subcommands might become available:

- Commands that affect fields (see "Field commands" on page 54)
- Commands that affect tables (see "Table commands" on page 53)

Subcommand scope is indicated in this CLI Reference Guide by indentation. For details, see "Indentation" on page 49.

Syntax examples for each top-level command in this CLI Reference Guide do not show all available subcommands. However, when nested scope is demonstrated, you should assume that subcommands applicable for that level of scope are available.

Table commands

delete <table_name>	Remove a table from the current object. For example, in `config system admin`, you could delete an administrator account named `newadmin` by typing `delete newadmin` and pressing Enter. This deletes `newadmin` and all its fields, such as `newadmin`'s `first-name` and `email-address`. `delete` is only available within objects containing tables.
edit <table_name>	Create or edit a table in the current object. For example, in `config system admin`: • Edit the settings for the default `admin` administrator account by typing `edit admin`. • Add a new administrator account with the name `newadmin` and edit `newadmin`'s settings by entering `edit newadmin`. `edit` is an interactive subcommand: further subcommands are available from within `edit`. `edit` changes the prompt to reflect the table you are currently editing. `edit` is only available within objects containing tables.
end	Save the changes to the current object and exit the `config` command. This returns you to the top-level command prompt.
get	List the configuration of the current object or table. • In objects, `get` lists the table names (if present), or fields and their values. • In a table, `get` lists the fields and their values. For more information on `get` commands, see "get" on page 672.
purge	Remove all tables in the current object. For example, in `config user local-user`, you could type `get` to see the list of all local user names, then type `purge` and then `y` to confirm that you want to delete all users. `purge` is only available for objects containing tables. **Caution:** Back up the FortiWeb appliance before performing a purge because it cannot be undone. To restore purged tables, the configuration must be restored from a backup. For details, see "backup cli-config" on page 641. **Caution:** Do not purge `system interface` or `system admin` tables. This can result in being unable to connect or log in, requiring the FortiWeb appliance to be formatted and restored.

show	Display changes to the default configuration. Changes are listed in the form of configuration commands. For more information on `show` commands, see "show" on page 677.

Example of table commands

From within the `system admin` object, you might enter:

```
edit admin_1
```

The CLI acknowledges the new table, and changes the command prompt to show that you are now within the `admin_1` table:

```
new entry 'admin_1' added
(admin_1)#
```

Field commands

abort	Exit both the `edit` and/or `config` commands without saving the fields.
end	Save the changes made to the current table or object fields, and exit the `config` command. To exit without saving, use `abort` instead.
get	List the configuration of the current object or table. • In objects, `get` lists the table names (if present), or fields and their values. • In a table, `get` lists the fields and their values.
next	Save the changes you have made in the current table's fields, and exit the `edit` command to the object prompt. To save and exit completely to the root prompt, use `end` instead. `next` is useful when you want to create or edit several tables in the same object, without leaving and re-entering the `config` command each time. `next` is only available from a table prompt; it is not available from an object prompt.
set <field_name> <value>	Set a field's value. For example, in `config system admin`, after entering `edit admin`, you could enter `set password newpass` to change the password of the `admin` administrator to `newpass`. **Note:** When using `set` to change a field containing a space-delimited list, enter the whole new list. For example, `set <field> <new-value>` will replace the list with the <`new-value`> rather than appending <`new-value`> to the list.
show	Display changes to the default configuration. Changes are listed in the form of configuration commands.

unset <field_name>	Reset the table or object's fields to default values. For example, in `config system admin`, after entering `edit admin`, entering `unset password` resets the password of the `admin` administrator account to the default (in this case, no password).

Example of field commands

From within the `admin_1` table, you might enter:

```
set password "my1stExamplePassword"
```

to assign the value `my1stExamplePassword` to the `password` field. You might then enter the `next` command to save the changes and edit the next administrator's table.

Permissions

Depending on the account that you use to log in to the FortiWeb appliance, you may not have complete access to all CLI commands or areas of the web UI.

Access profiles control which commands and areas an administrator account can access. Access profiles assign either:

- **Read** (view access)
- **Write** (change and execute access)
- Both **Read** and **Write**
- No access

to each area of the FortiWeb software. For details about configuring the access profile for an administrator account to use, see "system accprofile" on page 190.

Access profile permissions

Admin Users	**System > Admin** ... **except Settings**	Web UI
`admingrp`	`config system admin` `config system accprofile`	CLI
Auth Users	**User** ...	Web UI
`authusergrp`	`config user ...`	CLI
Log & Report	**Log&Report** ...	Web UI
`loggrp`	`config log ...` `execute formatlogdisk`	CLI
Maintenance	**System > Maintenance except System Time** tab	Web UI
`mntgrp`	`diagnose system ...`	CLI

	execute backup ... execute factoryreset execute reboot execute restore ... execute shutdown diagnose system flash ...	
Network Configuration	**System > Network** ...	Web UI
netgrp	config router ... config system interface config system dns config system v-zone diagnose network ... **except** sniffer ...	CLI
System Configuration	**System** ... **except Network**, **Admin**, and **Maintenance** tabs	Web UI
sysgrp	config system **except** accprofile, admin, dns, interface, and v-zone diagnose hardware ... diagnose network sniffer ... diagnose system ... **except** flash ... execute date ... execute ha ... execute ping ... execute ping-option ... execute traceroute ... execute time ...	CLI
Server Policy Configuration	**Policy** > **Server Policy** ... **Server Objects** ... **Application Delivery** ...	Web UI
traroutegrp	config server-policy ... **except** custom-application ... config waf file-compress-rule config waf http-authen ... config waf url-rewrite ... diagnose policy ...	CLI
Web Anti-Defacement Management	**Web Anti-Defacement** ...	Web UI
wadgrp	config wad ...	CLI
Web Protection Configuration	**Policy** > **Web Protection** ... **Web Protection** ... **DoS Protection** ...	Web UI
wafgrp	config system dos-prevention	CLI

	`config waf` **except**: • `config waf file-compress-rule` • `config waf http-authen ...` • `config waf url-rewrite ...` • `config waf web-custom-robot` • `config waf web-robot` • `config waf x-forwarded-for`	
Web Vulnerability Scan Configuration	**Web Vulnerability Scan** ...	Web UI
`wvsgrp`	`config wvs ...`	CLI

***** For each `config` command, there is an equivalent `get`/`show` command, unless otherwise noted.

`config` access requires write permission.

`get`/`show` access requires read permission.

Unlike other administrator accounts, the administrator account named `admin` exists by default and cannot be deleted. The `admin` administrator account is similar to a root administrator account. This administrator account always has full permission to view and change all FortiWeb configuration options, including viewing and changing **all** other administrator accounts. Its name and permissions cannot be changed. It is the only administrator account that can reset another administrator's password without being required to enter that administrator's existing password.

Set a strong password for the `admin` administrator account, and change the password regularly. By default, this administrator account has no password. Failure to maintain the password of the `admin` administrator account could compromise the security of your FortiWeb appliance.

For complete access to all commands, you must log in with the `admin` administrator account.

Tips & tricks

Basic features and characteristics of the CLI environment provide support and ease of use for many CLI tasks.

This section includes:

- "Editing the configuration file in a text editor" on page 61
- "Pipeline 'grep' command" on page 62

Help

To display brief help during command entry, enter the question mark (`?`) key:

- At the command prompt to display a list of the commands available and a description of each.
- After a command keyword to display a list of the objects available with that command and a description of each.
- After entering a word or part of a word to display a list of valid word completions or subsequent words, and to display a description of each.

Shortcuts & key commands

Action	Keys
List valid word completions or subsequent words. If multiple words could complete your entry, display all possible completions with helpful descriptions of each.	?
Complete the word with the next available match. Press the key multiple times to cycle through available matches.	Tab
Recall the previous command. Command memory is limited to the current session.	Up arrow, or Ctrl + P
Recall the next command.	Down arrow, or Ctrl + N
Move the cursor left or right within the command line.	Left or Right arrow
Move the cursor to the beginning of the command line.	Ctrl + A
Move the cursor to the end of the command line.	Ctrl + E
Move the cursor backwards one word.	Ctrl + B
Move the cursor forwards one word.	Ctrl + F
Delete the current character.	Ctrl + D
Abort current interactive commands, such as when entering multiple lines. If you are not currently within an interactive command such as `config` or `edit`, this closes the CLI connection.	Ctrl + C
Continue typing a command on the next line for a multi-line command.	\ then Enter

Action	Keys
For each line that you want to continue, terminate it with a backslash (\ ). To complete the command line, terminate it by pressing the spacebar and then the Enter key, without an immediately preceding backslash.	

Command abbreviation

You can abbreviate words in the command line to their smallest number of non-ambiguous characters. For example, the command `get system status` could be abbreviated to:

```
g sy st
```

If you enter an ambiguous command, the CLI returns an error message such as:

```
ambiguous command before 's'
Value conflicts with system settings.
```

Special characters

Special characters <, >, (,**)**, #, ', and " are usually not permitted in CLI. If you use them, the CLI will often return an error message such as:

```
The string contains XSS vulnerability characters

value parse error before '%^@'
Input not as expected.
```

Some may be enclosed in quotes or preceded with a backslash (\ ) character.

Entering special characters

Character	Key
?	Ctrl + V then ?
Tab	Ctrl + V then Tab
Space (to be interpreted as part of a string value, not to end the string)	Enclose the string in quotation marks: `"Security Administrator"` Enclose the string in single quotes: `'Security Administrator'` Precede the space with a backslash: `Security\ Administrator`
' (to be interpreted as part of a string value, not to end the string)	\'
"	\"

Character	Key
(to be interpreted as part of a string value, not to end the string)	
\	\\

Language support & regular expressions

The CLI currently supports the following languages:

- English
- Japanese
- Simplified Chinese
- Traditional Chinese

Characters such as ñ, é, symbols, and ideographs are sometimes acceptable input. Support varies by the nature of the item being configured. CLI commands, objects, field names, and options must use their exact ASCII characters, but some items with arbitrary names or values may be input using your language of choice.

For example, the host name must not contain special characters, and so the web UI and CLI will not accept most symbols and other non-ASCII encoded characters as input when configuring the host name. This means that languages other than English often are not supported. However, some configuration items, such as names and comments, may be able to use the language of your choice.

To use other languages in those cases, you must use the correct encoding.

FortiWeb stores inputs using Unicode UTF-8 encoding, but it is not normalized from other encodings into UTF-8 before stored. If your input method encodes some characters differently than in UTF-8, your configured items may not display or operate as expected.

Regular expressions are especially impacted. Matching uses the UTF-8 character values. If you enter a regular expression using another encoding, or if an HTTP client sends a request in an encoding other than UTF-8, matches may not be what you expect.

For example, with Shift-JIS, backslashes (\ ) could be inadvertently interpreted as yen symbols (¥) and vice versa. A regular expression intended to match HTTP requests containing money values with a yen symbol therefore may not work it if the symbol is entered using the wrong encoding.

For best results, you should use:

- UTF-8 encoding.
- Only the characters whose numerically encoded values are the same in UTF-8, such as the US-ASCII characters that are also encoded using the same values in ISO 8859-1, Windows code page 1252, Shift-JIS and other encodings.
- Regular expressions that match HTTP requests.
- The same encoding as your HTTP clients.

HTTP clients may send requests in encodings other than UTF-8. Encodings usually vary by the client's operating system or input language. If you cannot predict the client's encoding, you may only be able to match any parts of the request that are in English, because regardless of the encoding, the values for English characters tend to be encoded identically. For example, English words may be legible regardless of interpreting a web page as either ISO 8859-1 or as GB2312, whereas simplified Chinese characters might only be legible if the page is interpreted as GB2312.

To configure your FortiWeb appliance using other encodings, you may need to switch language settings on your management computer, including for your web browser or Telnet or SSH client. For instructions on how to configure your management computer's operating system language, locale, or input method, see its documentation.

If you choose to configure parts of the FortiWeb appliance using non-ASCII characters, verify that all systems interacting with the FortiWeb appliance also support the same encodings. You should also use the same encoding throughout the configuration if possible in order to avoid needing to switch the language settings of your web browser or Telnet or SSH client while you work.

Similarly to input, your web browser or CLI client should usually interpret display output as encoded using UTF-8. If it does not, your configured items may not display correctly in the web UI or CLI. Exceptions include items such as regular expressions that you may have configured using other encodings in order to match the encoding of HTTP requests that the FortiWeb appliance receives.

To enter non-ASCII characters in the CLI:

- **CLI access via the web UI**—Configure your web browser to interpret the page as UTF-8 encoded. The console will then display non-ASCII characters in commands in their character code equivalent.
- **CLI access via a Telnet or SSH client**—Configure the client to send and receive characters using UTF-8 encoding. Depending on the client, you may have to enter non-ASCII characters in commands in their character code equivalent.

Screen paging

When output spans multiple pages, you can configure the CLI to pause after each page. When the display pauses, the last line displays `--More--`. You can then either:

- Press the spacebar to display the next page.
- Enter `Q` to truncate the output and return to the command prompt.

This may be useful when displaying lengthy output, such as the list of possible matching commands for command completion, or a long list of settings. Rather than scrolling through or possibly exceeding the buffer of your terminal emulator, you can simply display one page at a time.

To configure the CLI display to pause after each full screen:

```
config system console
   set output more
end
```

For details, see "system console" on page 233.

Baud rate

You can change the default baud rate of the local console connection. For details, see "system console" on page 233.

Editing the configuration file in a text editor

Editing the configuration file with a plain text editor can be time-saving if:

- You have many changes to make
- Are not sure where the setting is in the CLI
- Own several FortiWeb appliances

This is true especially if your plain text editor provides advanced features such as regular expressions for find-and-replace, or batch changes across multiple files. Several free text editors are available with these features, such as Text Wrangler (http://www.barebones.com/products/textwrangler)and Notepad++ (http://notepad-plus-plus.org).

Do **not** use a rich text editor such as Microsoft Word. Rich text editors insert special characters into the file in order to apply formatting, which may corrupt the configuration file.

To edit the configuration on your computer

1. Use `execute backup cli-config` (page 641) or `execute backup full-config` (page 642) to download the configuration file to a TFTP server, such as your management computer.
2. Edit the configuration file using a plain text editor that supports Unix-style line endings.

Do not edit the first line. The first lines of the configuration file (preceded by a # character) contains information about the firmware version and FortiWeb model. If you change the model number, the FortiWeb appliance will reject the configuration file when you attempt to restore it.

3. Use `execute restore config` (page 662) to upload the modified configuration file back to the FortiWeb appliance.

   The FortiWeb appliance downloads the configuration file and checks that the model information is correct. If it is, the FortiWeb appliance loads the configuration file and checks each command for errors. If a command is invalid, the FortiWeb appliance ignores the command. If the configuration file is valid, the FortiWeb appliance restarts and loads the new configuration.

Pipeline 'grep' command

FortiWeb supports `'grep'` in `get` and `show` to search for desired information and present the results in a format you want.

The 'grep' command format is as follows:

```
get <xxx> [ [path] <object>] | grep [options] <search string>
```

```
show [ [path] <object>] | grep [options] <search string>
```

For example:

```
login as: admin
admin@10.200.30.101's password:
FortiWeb # get system status
International Version: FortiWeb-1000E 6.0.2,build0047(Interim),181030
Serial-Number: FV-1KE4417900014
Bios version: 00010002
Log hard disk: Available
Hostname: FortiWeb
Operation Mode: Reverse Proxy
FIPS-CC mode: disabled
Current HA mode: standalone
Database Status: Available

FortiWeb # get system status | grep version
Bios version: 00010002

FortiWeb # get system status | grep version -v
International Version: FortiWeb-1000E 6.0.2,build0047(Interim),181030
Serial-Number: FV-1KE4417900014
Log hard disk: Available
Hostname: FortiWeb
Operation Mode: Reverse Proxy
FIPS-CC mode: disabled
Current HA mode: standalone
Database Status: Available

FortiWeb # get system status | grep version -c
1

FortiWeb # get system status | grep version -n
3:Bios version: 00010002

FortiWeb # get system status | grep version
Bios version: 00010002

FortiWeb # get system status | grep version -n
3:Bios version: 00010002

FortiWeb # get system status | grep version -i
International Version: FortiWeb-1000E 6.0.2,build0047(Interim),181030
Bios version: 00010002
```

The following options are supported:

-n	Add 'line_no:' prefix.
-o	Show only the matching part of the line.
-v	Select non-matching lines.
-i	Ignore the case.

-w	Match whole words only.
-x	Match whole lines only.
-F	PATTERN is a literal (not regexp).
-E	PATTERN is an extended regexp.

Administrative domains (ADOMs)

Administrative domains (ADOMs) enable the `admin` administrator to constrain other FortiWeb administrators' access privileges to a subset of policies and protected host names. This can be useful for large enterprises and multi-tenant deployments such as web hosting.

ADOMs are **not** enabled by default. Enabling and configuring administrative domains can only be performed by the `admin` administrator.

Enabling ADOMs alters the structure of and the available functions in the GUI and CLI according to whether you're logging in as the `admin` administrator, and, if you are **not** logging in as the `admin` administrator, the administrator account's assigned access profile.

Differences between administrator accounts when ADOMs are enabled

	`admin` administrator account	**Other administrators**
Access to `config global`	Yes	No
Can create administrator accounts	Yes	No
Can create & enter all ADOMs	Yes	No

If ADOMs are enabled and you log in as `admin`, a superset of the typical CLI commands appear, allowing unrestricted access and ADOM configuration.

`config global` contains settings used by the FortiWeb itself and settings shared by ADOMs, such as RAID and administrator accounts. It does not include ADOM-specific settings or data, such as logs and reports. When configuring other administrator accounts, an additional option appears allowing you to restrict other administrators to an ADOM.

If ADOMs are enabled and you log in as any other administrator, you enter the ADOM assigned to your account. A subset of the typical menus or CLI commands appear, allowing access only to only logs, reports, policies, servers, and LDAP queries specific to your ADOM. You cannot access global configuration settings or enter other ADOMs.

By default, administrator accounts other than the `admin` account are assigned to the `root` ADOM, which includes all policies and servers. By creating ADOMs that contain a subset of policies and servers, and assigning them to administrator accounts, you can restrict other administrator accounts to a subset of the FortiWeb's total protected servers.

The `admin` administrator account cannot be restricted to an ADOM. Other administrators are restricted to their ADOM, and cannot configure ADOMs or global settings.

To enable ADOMs

1. Log in with the `admin` account.

   Other administrators do not have permissions to configure ADOMs.

Back up your configuration. Enabling ADOMs changes the structure of your configuration, and moves non-global settings to the `root` ADOM. For details about how to back up the configuration, see "backup full-config" on page 642.

2. Enter the following commands:

```
config system global
   set adom-admin enable
end
```

   FortiWeb terminates your administrative session.

3. Log in again.

   When ADOMs are enabled, and if you log in as `admin`, the top level of the shell changes: the two top level items are `config global` and `config vdom`.

   - `config global` contains settings that only `admin` or other accounts with the **prof_admin** access profile can change.
   - `config vdom` contains each ADOM and its respective settings.

   This menu and CLI structure change is not visible to non-global accounts; ADOM administrators' navigation menus continue to appear similar to when ADOMs are disabled, except that global settings such as network interfaces, HA, and other global settings do not appear.

4. Continue by defining ADOMs. For details, see "Defining ADOMs" on page 66.

To disable ADOMs

1. Delete all ADOM administrator accounts.

Back up your configuration. Disabling ADOMs changes the structure of your configuration, and deletes most ADOM-related settings. It keeps settings from the `root` ADOM only. For details about how to back up the configuration, see "backup full-config" on page 642.

2. Enter the following commands:

```
config system global
   set adom-admin disable
end
```

   FortiWeb terminates your administrative session.

3. Continue by reconfiguring the appliance. For details, see the *FortiWeb Administration Guide*:

   http://docs.fortinet.com/fortiweb/admin-guides

See also

- "Permissions" on page 55
- "Defining ADOMs" on page 66
- "Assigning administrators to an ADOM" on page 67
- "system admin" on page 193
- "system accprofile" on page 190

Defining ADOMs

Some settings can only be configured by the `admin` account—they are **global**. Global settings apply to the appliance overall regardless of ADOM, such as:

- Operation mode
- Network interfaces
- System time
- Backups
- Administrator accounts
- Access profiles
- FortiGuard connectivity settings
- HA and configuration sync
- SNMP
- RAID
- X.509 certificates
- TCP `SYN` flood anti-DoS setting
- Vulnerability scans
- "ping" on page 653 and other global operations that exist only in the CLI

Only the `admin` account can configure global settings.

In the current release, some settings, such as user accounts for HTTP authentication, anti-defacement, and logging destinations are read-only for ADOM administrators. Future releases will allow ADOM administrators to configure these settings separately for their ADOM.

Other settings can be configured separately for each ADOM. They essentially define each ADOM. For example, the policies of adom-A are separate from adom-B.

Initially, only the `root` ADOM exists, and it contains settings such as policies that were global before ADOMs were enabled. Typically, you will create additional ADOMs, and few if any administrators will be assigned to the `root` ADOM.

After ADOMs are created, the `admin` account usually assigns other administrator accounts to configure their ADOM-specific settings. However, as the root account, the `admin` administrator does have permission to configure all settings, including those within ADOMs.

To create an ADOM

1. Log in with the `admin` account.
2. Enter the following commands:

```
config vdom
   edit <adom_name>
```

where <adom_name> is the name of your new ADOM. Alternatively, to configure the default root ADOM, type root.

The maximum number of ADOMs you can add varies by your FortiWeb model. The number of ADOMs is limited by available physical memory (RAM), and therefore also limits the maximum number of policies and sessions per ADOM. For details, see the *FortiWeb Administration Guide*:

http://docs.fortinet.com/fortiweb/admin-guides

The new ADOM exists, but its settings are not yet configured.

3. Either:
   - Assign another administrator account to configure the ADOM (continue with "Assigning administrators to an ADOM" on page 67), or
   - Configure the ADOM yourself by entering commands such as:

```
config log...
config server-policy...
config system...
config waf...
```

Assigning administrators to an ADOM

The admin administrator can create other administrators and assign their account to an ADOM, constraining them to that ADOM's configurations and data.

To assign an administrator to an ADOM

1. If you have not yet created any administrator access profiles, create at least one. For details, see "system accprofile" on page 190.
2. In the administrator account's `accprofile "<access-profile_name>"` (page 194) setting, select the new access profile.

   (Administrators assigned to the **prof_admin** access profile will have global access. They cannot be restricted to an ADOM.)
3. In the administrator account's `domains "<adom_name>"` (page 195) setting, select the account's assigned ADOM. Currently, in this version of FortiWeb, administrators cannot be assigned to more than one ADOM.

Although not usually explicitly shown in each config command's "Syntax" section, for all `config` commands, there are related `get` (page 672) and `show` (page 677) commands which display that part of the configuration, either in the form of a list of settings and values, or commands that are required to achieve that configuration from the firmware's default state, respectively. `get` and `show` commands use the same syntax as their related `config` command, unless otherwise mentioned.

log alertMail

Use this command to enable or disable alert emails, and to choose which email policy to use with them. Alert emails notify administrators or other personnel when an alert condition occurs, such as a system failure or network attack.

The email address information and the alert message intervals are configured separately for each email policy. For details about the severity levels of log messages associated with an email policy, see "log email-policy" on page 79.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log alertMail
   set status {enable | disable}
   set email-policy "<policy_name>"
end
```

Variable	Description	Default
`status {enable | disable}`	Enable to generate an alert email when the FortiWeb appliance records a log message, if that log message meets or exceeds the severity level configured in "log email-policy" on page 79.	`disable`
`email-policy "<policy_name>"`	Enter the name of a previously configured email policy. The maximum length is 63 characters. To display a list of the existing email policies, type: `set email-policy ?`	No default.

Example

This example enables alert email when either a system event or attack log message is logged. The alert email is sent using the recipients configured in `emailpolicy1`.

```
config log alertMail
   set status enable
   set email-policy "emailpolicy1"
end
```

Related topics

log attack-log

Use this command to configure recording of attack log messages on the local FortiWeb disk.

You must enable disk log storage and select log severity levels using `config log disk` (page 77) before any attack logs can be stored on disk.

Also use this command to define specific packet payloads to retain when storing attack logs.

Packet payloads can be retained for specific attack types or validation failures detected by the FortiWeb appliance. Packet payloads supplement the log message by providing the actual data that triggered the attack log, which may help

you to fine-tune your regular expressions to prevent false positives. You can also examine changes to attack behavior for subsequent forensic analysis. Alternatively, for more extensive packet logging, you can run a packet trace. For details, see "network sniffer" on page 621.

If the offending HTTP request exceeds 4 kilobytes (KB), the FortiWeb appliance retains only 4 KB' of the part of the payload that triggered the log message.

You can view attack log packet payloads from the **Packet Log** column using the web UI. For details, see the *FortiWeb Administration Guide*:

http://docs.fortinet.com/fortiweb/admin-guides

Packet payloads can contain sensitive information. You can prevent sensitive data from display in the packet payload by applying sensitivity rules that detect and obscure sensitive information. For details, see "log sensitive" on page 97.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log attack-log
   set status {enable | disable}
   set http-parse-error-output {enable | disable}
   set packet-log {account-lockout-detection | anti-virus-detection | cookie-security |
       credential-db-detection | csrf-detection | custom-access | custom-protection-rule
       | fsa-detection | hidden-fields-failed | http-protocol-constraints | illegal-
       file-type | illegal-filesize | illegal-json-format | illegal-xml-format | ip-
       intelligence | padding-oracle | parameter-rule-failed | signature-detection |
       trojan-detection | user-tracking-detection | xml-protection | machine-learning |
       openapi-validation | websocket-security}
   set no-ssl-error {enable | disable}
end
```

Variable	Description	Default
`status {enable | disable}`	Enable to record attack log messages on the disk. To record attack logs, disk log storage must be enabled, and the severity levels selected using the `config log disk` (page 77) command.	`enable`
`http-parse-error-output {enable | disable}`	Enable while debugging only, to log errors of the HTTP protocol parser.	`disable`
`packet-log {account-lockout-detection | anti-virus-detection | cookie-security | credential-db-detection | csrf-detection | custom-access | custom-protection-rule | fsa-detection | hidden-fields-failed | http-`	Select one or more detected attack types or validation failures. FortiWeb keeps packet payloads from its HTTP parser buffer with their associated attack log message. Separate each attack type with a space. To add or remove a packet payload type, re-type the entire space-delimited list with the new option included or omitted. Some options have historical names. Correlations with current feature names are:	No default.

Variable	Description	Default
`protocol-constraints | illegal-file-type | illegal-filesize | illegal-json-format | illegal-xml-format | ip-intelligence | padding-oracle | parameter-rule-failed | signature-detection | trojan-detection | user-tracking-detection | xml-protection | machine-learning | openapi-validation | websocket-security}`	• `custom-protection-rule`—Custom signature detection (not predefined) To empty this list and keep no packet payloads, effectively disabling the feature, enter `unset packet-log`.	
`no-ssl-error {enable | disable}`	Enable to stop FortiWeb from logging SSL errors. This setting is useful when you use high-level security settings, which generate a high volume of these types of errors.	`disable`

Example

This example enables log storage on the hard disk and sets `information` as the minimum severity level that a log message must meet in order for the log to be stored. It also enables retention of packet payloads that triggered custom protection rules along with their correlating attack logs. Conversely, it disables any other packet payload retention that may have been enabled before, because it completely replaces the list each time it is configured.

```
config log disk
   set status enable
   set severity information
end
config log attack-log
   set status enable
   set packet-log custom-protection-rule
end
```

- "log " on page 615

log custom-sensitive-rule

Use this command to configure custom rules to obscure sensitive information that is not obscured in log message packet payloads by the predefined sensitivity rules.

Use this command in conjunction with `config log sensitive` (page 97).

If enabled to do so, a FortiWeb appliance will obscure predefined data types, including user names and passwords in log message packet payloads. If other sensitive data in the packet payload is not obscured by the predefined data types, you can create your own data type sensitivity rules, such as ages or other identifying numbers.

Sensitive data definitions are **not** retroactive. They will hide strings in subsequent log messages, but will not affect existing log messages.

This command is relevant only if you have enabled the FortiWeb appliance to keep packet payloads along with their associated log messages, and have selected to obscure logs according to custom data types. For details, see "log attack-log" on page 72 and "log sensitive" on page 97.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log custom-sensitive-rule
   edit "<custom-sensitive-rule_name>"
      set expression "<sensitive-type_pattern>"
      set field-name "<parameter-name_pattern>"
      set field-value "<parameter-value_pattern>"
      set type {field-mas-rule | general-mask-rule}
   next
end
```

Variable	Description	Default
`"<custom-sensitive-rule_name>"`	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.
`expression "<sensitive-type_pattern>"`	Enter a regular expression that matches all and only the strings or numbers that you want to obscure in the packet payloads. For example, to hide a parameter that contains the age of users under 13, you could enter: `age\=[1-13]`	No default.

Variable	Description	Default
	Expressions must not start with an asterisk (*). The maximum length is 255 characters.	
type {field-mas-rule | general-mask-rule}	Select either general-mask-rule (a regular expression that will match any substring in the packet payload) or field-mask-rule (a regular expression that will match only the value of a specific form input). If you select general-mask-rule, configure expression "<sensitive-type_pattern>" (page 75). If you select field-mask-rule, configure field-name "<parameter-name_pattern>" (page 76) and field-value "<parameter-value_pattern>" (page 76).	general-mask-rule
field-name "<parameter-name_pattern>"	Enter a regular expression that matches all and only the input names whose values you want to obscure. The input name itself will **not** be obscured. If you wish to do this, use general-mask-rule instead. The maximum length is 255 characters.	No default.
field-value "<parameter-value_pattern>"	Enter a regular expression that matches all and only the input values that you want to obscure. The maximum length is 255 characters. For example, to hide a parameter that contains the age of users under 13, for field-name "<parameter-name_pattern>" (page 76), enter age, and for field-value "<parameter-value_pattern>" (page 76), enter [1-13]. Valid expressions must not start with an asterisk (*). **Caution:** Field masks using asterisks are greedy: a match for the parameter's value will obscure it, but will **also** obscure the rest of the parameters in the line. To avoid this, enter an expression whose match terminates with, but does not consume, the parameter separator. For example, if parameters are separated with an ampersand (&), and you want to obscure the value of the field name username but **not** any of the parameters that follow it, you could enter the field value: .*?(?=\&) This would result in: username****&age=13&origurl=%2Flogin	No default.

Example

This example enables the FortiWeb appliance to keep all types of packet payloads with their associated log messages. It also enables and defines a custom sensitive data type (applies to age 13 or less) that will be obscured in logs.

```
config log attack-log
   set status enable
   set packet-log anti-virus-detection cookie-poison custom-access custom-protection-rule
       hidden-fields-failed http-protocol-constraints illegal-file-type illegal-xml-format
       ip-intelligence padding-oracle parameter-rule-failed signature-detection
end
config log sensitive
   set type custom-rule
end
config log custom-sensitive-rule
   edit rule1
      set type general-mask-rule
      set expression "age\\=[1-13]*$"
   next
end
```

- "log traffic-log" on page 104

log disk

Use this command to enable and configure recording of log messages to the local hard disk.

Logging must be enabled for each individual log type before log messages are recorded to disk. For details, see "log attack-log" on page 72, "log event-log" on page 82, and "log traffic-log" on page 104 for details.

Each log file can have at most 51,200 logs, and each log size is limited to 4k; thus, each log file size is limited to 200M.

You can use SNMP traps to notify you when disk space usage exceeds 80%. For details, see "system snmp community" on page 301.

You can generate reports based on log messages that you save to the local hard disk. For details, see "log reports" on page 87.

Syntax

```
config log disk
   set diskfull overwrite
   set severity {alert | critical | debug | emergency | error | information |
       notification | warning}
   set status {enable | disable}
   set log-used-disk <log-used-disk_int>
```

```
end
```

Variable	Description	Default
`status {enable | disable}`	Enable to store log messages on the local hard disk. Log messages are stored only if logging is enabled for the individual log types using `config log attack-log` (page 72), `config log event-log` (page 82), and `config log traffic-log` (page 104). Also configure `diskfull overwrite` (page 78) and `severity {alert | critical | debug | emergency | error | information | notification | warning}` (page 78).	`enable`
`diskfull overwrite`	Select `overwrite` to delete the oldest log file in order to free disk space, and then store the new log message. This field is available only if `status {enable | disable}` (page 78) is `enable`.	`overwrite`
`severity {alert | critical | debug | emergency | error | information | notification | warning}`	Select the severity level that a log message must meet or exceed in order to cause the FortiWeb appliance to record it.	`information`
`log-used-disk <log-used-disk_int>`	This field is unique for Docker platform. Enter the log disk size. The valid range is 10–500 G.	`10 G`

Example

This example enables logging of event and attack logs and recording of the log messages to the local hard disk. Only the log messages with a severity of `notification` or higher are recorded. If all free space on the hard disk is consumed and a new log message is generated, the `diskfull` option determines that the FortiWeb will overwrite the oldest log message. The log messages are saved to a separated log file for each message type.

```
config log disk
   set status enable
   set severity notification
   set diskfull overwrite
end
```

log email-policy

Use this command to create an email policy. An email policy identifies email recipients, email address, email connection requirements and authentication information, if required.

You can configure multiple email policies and apply those policies as required in different situations. The FortiWeb appliance can be configured to send email for different situations, such as to alert administrators when certain system events or rule violations occur, or when log reports are available for distribution.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log email-policy
   edit "<email-policy_name>"
      set mailfrom "<address_str>"
      set mailto1 "<recipient_email>"
      set mailto2 "<recipient_email>"
      set mailto3 "<recipient_email>"
      set smtp-server {"<smtp_ipv4>" | "<smtpfqdn>"}
      set smtp-port <smtp-port_int>
      set smtp-auth {enable | disable}
      set smtp-username "<auth_str>"
      set smtp-password "<password_str>"
      set severity {alert | critical | debug | emergency | error | information |
          notification | warning}
      set interval <interval_int>
      set connection-security {NONE | STARTTLS | SSL/TLS}
      set attach-compression {enable | disable}
      set send-email-based-on-interval-time {enable | disable}
      set company-logo "<company-logo_str>"
      set company-name "<company-name_str>"
   next
end
```

Variable	Description	Default
"<email-policy_name>"	Enter the name of an email policy. The maximum length is 63 characters.	No default.
mailfrom "<address_str>"	Enter the sender email address, such as FortiWeb@example.com, that the FortiWeb appliance will use when sending email. The maximum length is 63 characters.	No default.
mailto1 "<recipient_email>"	Enter the email address of the first recipient, such as admin@example.com, to which the FortiWeb appliance will	No default.

Variable	Description	Default
	send email. You must enter one email address for alert email to function. The maximum length is 63 characters.	
`mailto2 "<recipient_email>"`	Enter the email address of the second recipient, if any, to which the FortiWeb appliance will send alert email. The maximum length is 63 characters.	No default.
`mailto3 "<recipient_email>"`	Enter the email address of the third recipient, if any, to which the FortiWeb appliance will send alert email. The maximum length is 63 characters.	No default.
`smtp-server {"<smtp_ipv4>" | "<smtpfqdn>"}`	Enter the IP address or fully qualified domain name (FQDN) of the SMTP server, such as `mail.example.com`, that the FortiWeb appliance can use to send email. The maximum length is 63 characters.	No default.
`smtp-port <smtp-port_int>`	Enter the port on the SMTP server that listens for alerts and generated reports from FortiWeb. The valid range is 1–65,535.	25
`smtp-auth {enable | disable}`	Enable if the SMTP server requires authentication. Also enable if authentication is not required but is available and you want the FortiWeb appliance to authenticate.	`disable`
`smtp-username "<auth_str>"`	If you enable `smtp-auth {enable | disable}` (page 80), enter the user name that the FortiWeb appliance will use to authenticate itself with the SMTP relay. The maximum length is 63 characters. This field is available only if you enable `smtp-auth {enable | disable}` on page 80.	No default.
`smtp-password "<password_str>"`	If you enable `smtp-auth {enable | disable}` on page 80, enter the password that corresponds with the user name. This field is available only if you enable `smtp-auth {enable | disable}` on page 80.	No default.
`severity {alert | critical | debug | emergency | error | information | notification | warning}`	Select the severity threshold that log messages must meet or exceed in order to cause an email alert.	`emergency`
`interval <interval_int>`	Enter the number of minutes FortiWeb waits to send an additional alert if an alert condition of the specified severity level continues to occur after the initial alert.	1

Variable	Description	Default
	The valid range is 1–2,147,483,647.	
`connection-security {NONE | STARTTLS | SSL/TLS}`	Select one of the following options: • `NONE`—FortiWeb applies no security protocol to email. • `STARTTLS`—Encrypts the connection to the SMTP server using STARTTLS. • `SSL/TLS`—Encrypts the connection to the SMTP server using SSL/TLS.	NONE
`attach-compression {enable | disable}`	Enable or disable the compression for an alert email policy. With the compression function being enabled, event logs and alerts will be attached to the emails in ZIP format, otherwise they will be attached in TXT format.	`disable`
`send-email-based-on-interval-time {enable | disable}`	Enable/disable sending emails by interval time.	No default.
`company-logo "<company-logo_str>"`	Set the company logo in the email policy by entering a Base64 string (base64 encoding) of the image. Only JPG format is supported. Size limit is 36 KB. You are strongly recommended to upload a company logo through the FortiWeb GUI.	No default.
`company-name "<company-name_str>"`	Set the company name in the email policy. The maximum length is 63 characters.	No default.

Example

This example creates email policy for use in multiple situations. When the email policy is attached to rule violations or log reports, FortiWeb sends an email from `fortiweb@example.com`, to `admin@example.com and analysis@example.com`, using an SMTP server `mail.example.com`. The SMTP server requires authentication. The FortiWeb appliance authenticates as `fortiweb` when connecting to the SMTP server.

FortiWeb logs messages more severe than a notification. As long as events continue to trigger notification-level log messages, FortiWeb sends an alert email every 10 minutes. (Log messages of other severity levels trigger alert email at their default intervals.) All the related log messages will be attached to the emails in ZIP format.

When the configuration is complete, log in to the web UI to send a sample alert email to test the configuration and the email system.

```
config log email-policy
  edit "Email_Policy1"
     set mailfrom "fortiweb@example.com"
     set mailto1 "admin@example.com"
     set mailto2 "analysis@example.com"
     set smtp-server "mail.example.com"
     set smtp-auth enable
     set smtp-username "fortiweb"
```

```
      set smtp-password "fortiWebPassworD2"
      set severity notification
      set interval 10
      set attach-compression enable
    next
end
```

log event-log

Use this command to configure recording of event log messages, and then use other commands to store those messages on the local FortiWeb disk, in local FortiWeb memory, or both. Use other commands to configure a traffic log and attack log.

You must enable disk and/or memory log storage and select log severity levels before FortiWeb will store any event logs.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log event-log
  set status {enable | disable}
  set cpu-high <percentage_int>
  set mem-high <percentage_int>
  set logdisk-high <percentage_int>
  set trigger-policy "<trigger-policy_name>"
end
```

Variable	Description	Default
`status {enable | disable}`	Enable to record event log messages. To select the destination and the severity threshold of the stored log messages, see "log disk" on page 77.	`enable`
`cpu-high <percentage_int>`	Enter a threshold level as a percentage beyond which CPU usage triggers an event log entry. The valid range is 60–99.	`60`

Variable	Description	Default
`mem-high <percentage_int>`	Enter a threshold level as a percentage beyond which memory usage triggers an event log entry. The valid range is 60–99.	`60`
`logdisk-high <percentage_int>`	Enter a threshold level as a percentage beyond which log disk usage triggers an event log entry. The valid range is 60–99.	`60`
`trigger-policy "<trigger-policy_name>"`	Enter the name of the trigger to apply when the CPU, memory, log disk usage, or number of sessions meets or exceeds the threshold (see "log trigger-policy" on page 105). The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.

Example

This example enables recording of event logs, enables disk log storage and memory log storage, and sets `alert` as the minimum severity level that a log message must achieve for storage.

```
config log disk
   set status enable
   set severity alert
end
config log event-log
   set status enable
end
```

log forti-analyzer

Use this command to configure the FortiWeb appliance to send its log messages to a remote FortiAnalyzer appliance.

You must first define one or more FortiAnalyzer policies using `config log fortianalyzer-policy` (page 85).

Logs sent to FortiAnalyzer are controlled by FortiAnalyzer policies and trigger actions that you configure on the FortiWeb appliance, and are associated with various types of violations.

Logs stored remotely cannot be viewed from the web UI, and cannot be used by FortiWeb to build reports. If you require these features, record logs locally as well as remotely.

Usually, you should set trigger actions for specific types of violations. Failure to do so will result in the FortiWeb appliance logging every occurrence, which could result in high log volume and reduced system performance. Excessive logging for an extended period of time may cause premature hard disk failure.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log forti-analyzer
   set fortianalyzer-policy "<policy_name>"
   set status {enable | disable}
   set severity {alert | critical | debug | emergency | error | information |
       notification | warning}
end
```

Variable	Description	Default
`fortianalyzer-policy "<policy_name>"`	Enter the name of an existing FortiAnalyzer policy to use when storing log information remotely. The maximum length is 63 characters. To view a list of the existing FortiAnalyzer policies, enter : `set fortianalyzer-policy ?`	No default.
`status {enable | disable}`	Enable to record event log messages to FortiAnalyzer if it meets or exceeds the severity level configured in `severity`.	`disable`
`severity {alert | critical | debug | emergency | error | information | notification | warning}`	Select the severity level that a log message must meet or exceed in order to cause the FortiWeb appliance to save it to FortiAnalyzer.	`information`

Example

This example enables FortiAnalyzer logging and recording of the log messages. Only the log messages with a severity of `error` or higher are recorded.

```
config log forti-analyzer
   set status enable
   set severity error
end
```

- "log fortianalyzer-policy" on page 85

log fortianalyzer-policy

Use this command to create policies for use by protection rules to store log messages remotely on a FortiAnalyzer appliance. For example, once you create a FortiAnalyzer policy, you can include it in a trigger policy, which in turn can be applied to a trigger action in a protection rule.

You need to create a FortiAnalyzer policy if you also plan to send log messages to a FortiAnalyzer appliance.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log fortianalyzer-policy
  edit "<policy_name>"
    config fortianalyzer-server-list
      edit <entry_index>
        set ip-address "<forti-analyzer_ipv4>"
        set enc-algorithm {disable | default}
      end
    next
end
```

Variable	Description	Default
`"<policy_name>"`	Enter the name of the new or existing FortiAnalyzer policy. The maximum length is 63 characters. To display a list of the existing policies, enter: `edit ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table.	No default.
`ip-address "<forti-analyzer_ipv4>"`	Enter the IP address of the remote FortiAnalyzer appliance.	No default.
`enc-algorithm {disable | default}`	Specifies whether FortiWeb transmits logs to the FortiAnalyzer appliance using SSL.	`disable`

Example

This example creates a policy entry and assigns an IP address, then enables FortiAnalyzer logging for log messages with a severity of `error` or higher.

```
config log fortianalyzer-policy
```

```
    edit "fa-policy1"
       config fortianalyzer-policy
          edit 1
             set ip-address "192.0.2.133"
          end
       next
end
config log forti-analyzer
   set fortianalyzer-policy "fa-policy1"
   set status enable
   set severity error
end
```

log ftp-policy

Use this command to configure a connection to an FTP or TFTP server. The `config log reports` configuration uses this policy to specify a server that FortiWeb sends reports to.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log ftp-policy
   edit "<policy_name>"
      set type {ftp | tftp}
      set server "<ftp-server_ipv4>"
      set ftp_auth {enable | disable}
      set ftp_user "<ftp-user_str>"
      set ftp_passwd "<ftp_pswd>"
      set ftp-dir "<ftp-dir_str>"
end
```

Variable	Description	Default
"<policy_name>"	Enter the name of a new or existing FTP/TFTP policy. The maximum length is 63 characters. To display the list of existing policies, enter: `edit ?`	No default.
type {ftp | tftp}	Specify whether the server is FTP or TFTP.	ftp
server "<ftp-server_ipv4>"	Enter the IP address of the FTP or TFTP server.	No default.

Variable	Description	Default
`ftp_auth {enable | disable}`	Specify whether the server requires a user name and password for authentication, rather than allowing anonymous connections. Available only if `type {ftp | tftp}` (page 86) is `ftp`.	`disable`
`ftp_user "<ftp-user_str>"`	Enter the user name that FortiWeb uses to authenticate with the server. Available only if `ftp_auth {enable | disable}` (page 87) is `enable`.	No default.
`ftp_passwd "<ftp_pswd>"`	Enter the password for the specified username. Available only if `ftp_auth {enable | disable}` (page 87) is `enable`.	No default.
`ftp-dir "<ftp-dir_str>"`	Enter the location on the server where FortiWeb stores reports.	No default.

log reports

Use this command to configure report profiles.

When generating a report, FortiWeb appliances collate information collected from their log files and present the information in tabular and graphical format.

In addition to log files, your FortiWeb appliance requires a report profile to generate a report. A report profile is a group of settings that contains the report name, file format, subject matter, and other aspects that the FortiWeb appliance considers when generating the report.

FortiWeb appliances can generate reports automatically, according to the schedule that you configure in the report profile, or manually in the web UI when you click the **Run now** icon in the report profile list. You may want to create one report profile for each type of report that you will generate on demand or periodically, by schedule.

Generating reports can be resource intensive. To avoid email processing performance impacts, you may want to generate reports during times with low traffic volume, such as at night.

The number of results in a section's table or graph varies by the report type.

Ranked reports (top **x**, or top **y** of top **x**) can include a different number of results per cross-section, then combine remaining results under "Others." For example, in "Top Attack Severity by Hour of Day," the report includes the top **x** hours, and their top **y** attacks, then groups the remaining results.

- `scope_top1 <topX_int>` (page 95) is **x**.
- `scope_top2 <topY_int>` (page 95) is **y**.

Before you generate a report, collect log data that will be the basis of the report. For information on enabling logging to the local hard disk, see "log attack-log" on page 72 and "log disk" on page 77.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Creating a report profile is considerably easier in the web UI. Go to **Log&Report > Report Config**.

Syntax

```
config log reports
  edit "<report_name>"
    set custom_company "<org_str>"
    set custom_footer_options {custom | report-title}
    set custom_header "<header_str>"
    set custom_header_logo "<filename_hex_str>"
    set custom_title_logo "<filename_hex_str>"
    set email_attachment_compress {enable | disable}
    set email_attachment_name "<filename_str>"

```

Variable	Description	Default
`"<report_name>"`	Enter the name of a new or existing report profile. The maximum length is 63 characters. The profile name will be included in the report header. To display the list of existing report names, enter: `edit ?`	No default.
`custom_company "<org_str>"`	Enter the name of your department, company, or other organization, if any, that you want to include in the report summary. If the text is more than one word or contains special characters, enclose it in double quotes (`"`). The maximum length is 191 characters. For details about enabling the summary, see `scope_include_summary {yes | no}` (page 95).	No default.
`custom_footer_options {custom | report-title}`	Select either: • `report-title`—Use `"<report_name>"` (page 89) as the footer text. • `custom`—Provide different footer text.	`report-title`
`custom_footer "<footer_str>"`	Enter the text, if any, that you want to include at the bottom of each report page. If the text is more than one word or contains special characters, enclose it in double quotes (`"`). The maximum length is 127 characters. This setting is available only if `custom_footer_options {custom | report-title}` (page 89) is `custom`.	No default.

Variable	Description	Default
`custom_header "<header_str>"`	Enter the text, if any, that you want to include at the top of each report page. If the text is more than one word or contains special characters, enclose it in double quotes ("). The maximum length is 127 characters.	No default.
`custom_header_logo "<filename_hex_str>"`	Enter the file name of a custom logo that you have previously uploaded to the FortiWeb appliance. The logo image will be included in the report header. The maximum length is 255 characters.	No default.
`custom_title_logo "<filename_hex_str>"`	Enter the file name of a custom logo that you have previously uploaded to the FortiWeb appliance. The logo image will be included in the report title. The maximum length is 255 characters.	No default.
`email_attachment_compress {enable | disable}`	Enable to enclose the generated report formats in a compressed archive attached to the email. This field is required if you have enabled email output by enabling one or more of the file formats for email output in `output_email {html mht pdf rtf txt}` (page 91).	`disable`
`email_attachment_name "<filename_str>"`	Enter the file name that will be used for the reports attached to the email. The maximum length is 63 characters. This field is required if you have enabled email output by enabling one or more of the file formats for email output in `output_email {html mht pdf rtf txt}` (page 91).	No default.
`email_body "<message_str>"`	Enter the message body of the email. The maximum length is 383 characters. This field is required if you have enabled email output by enabling one or more of the file formats for email output in `output_email {html mht pdf rtf txt}` (page 91).	No default.
`email_subject "<subject_str>"`	Enter the subject line of the email. The maximum length is 191 characters. This field is required if you have enabled email output by enabling one or more of the file formats for email output in `output_email {html mht pdf rtf txt}` (page 91).	No default.
`filter_string "<log-filter_str>"`	Enter a log message filter string that includes or excludes log messages based upon matching log field values. The maximum length is 1,023 characters. For example syntax, see "Example" on page 96.	No default.
`include_nodata {yes | no}`	Select whether to include (`yes`) or hide (`no`) reports which are empty because there is no matching log data.	`no`

Variable	Description	Default
`on_demand {enable | disable}`	Enable to run the report one time only. After the FortiWeb appliance completes the report, it removes the report profile from its hard disk. Enter `disable` to schedule a time to run the report, and to keep the report profile for subsequent use.	`disable`
`output_email {html mht pdf rtf txt}`	Select one or more file types for the report when mailing generated reports.	No default.
`output_email_policy "<policy_name>"`	If you set a value for `output_email`, enter the name of the email policy that contains settings for sending the report by email. The maximum length is 63 characters. For details about email policies, see "log email-policy" on page 79.	No default.
`output_file {html mht pdf rtf txt}`	Select one or more file types for the report when saving to the FortiWeb hard disk.	`html`
`output_ftp {html pdf rtf txt mht}`	Select one or more file types for the report when FortiWeb sends reports to an FTP or TFTP server.	No default.
`output_ftp_policy "<ftp-policy_name>"`	Enter the policy that defines a connection to the appropriate server. For details, see "log ftp-policy" on page 86.	No default.
`period_end "<time_str>" "<date_str>"`	Enter the time and date that define the **end** of the span of time whose log messages you want to use when generating the report. The time format is `hh:mm` and the date format is `yyyy/mm/dd`, where: • `hh` is the hour according to a 24-hour clock • `mm` is the minute • `yyyy` is the year • `mm` is the month • `dd` is the day This setting appears only when you select a `period_type {last-14-days | last-2-weeks | last-30-days | last-7-days | lastmonth | last-n-days | last-n-hours | last-n-weeks | last-quarter | last-week | other | this-month | this-quarter | this-week | thiyear | today | yesterday}` (page 92) of `other`.	No default.
`period_last_n <n_int>`	Enter the number that defines **n** if the `period_type {last-14-days | last-2-weeks | last-30-`	No default.

Variable	Description	Default
	days | last-7-days | lastmonth | last-n-days | last-n-hours | last-n-weeks | last-quarter | last-week | other | this-month | this-quarter | this-week | thiyear | today | yesterday} (page 92) contains that variable. The valid range is from 1 to 2,147,483,647. This setting appears only when you select a period_type of last-n-days, last-n-hours, or last-n-weeks.	
period_start "<time_str>" "<date_str>"	Enter the time and date that defines the **beginning** of the span of time whose log messages you want to use when generating the report. The time format is hh:mm and the date format is yyyy/mm/dd, where: • hh is the hour according to a 24-hour clock • mm is the minute • yyyy is the year • mm is the month • dd is the day This setting appears only when you select a period_type {last-14-days | last-2-weeks | last-30-days | last-7-days | lastmonth | last-n-days | last-n-hours | last-n-weeks | last-quarter | last-week | other | this-month | this-quarter | this-week | thiyear | today | yesterday} (page 92) of other.	No default.
period_type {last-14-days | last-2-weeks | last-30-days | last-7-days | lastmonth | last-n-days | last-n-hours | last-n-weeks | last-quarter | last-week | other | this-month | this-quarter | this-week | thiyear | today | yesterday}	Select the span of time whose log messages you want to use when generating the report. If you select last-n-days, last-n-hours, or last-nweeks, you must also define **n** by entering period_last_n <n_int> (page 91). If you select other, you must also define the start and end of the report's time range by entering period_start "<time_str>" "<date_str>" (page 92) and period_end "<time_str>" "<date_str>" (page 91). The span of time will be included in the summary, if enabled. For information on enabling the summary, see scope_include_summary {yes | no} (page 95).	last-7-days
report_desc "<comment_str>"	Enter a description of the report, if any, that you want to include in the report summary. If the text is more than one	No default.

Variable	Description	Default
	word or contains special characters, surround it with double quotes ("). The maximum length is 63 characters. For information on enabling the summary, see scope_include_summary {yes | no} (page 95).	
report_title "<title_str>"	Enter a title, if any, that you want to include in the report summary. If the text is more than one word or contains special characters, enclose it in double quotes ("). The maximum length is 127 characters. For information on enabling the summary, see scope_include_summary {yes | no} (page 95).	No default.
report_attack_activity {attacks-type attacks-url attacks-date-type attacks-month-type attacks-day-type attacks-hour-type attacks-type-dev attacks-dst-type attacks-dst-ip attacks-type-ip attacks-method-type attacks-cat attacks-policy attacks-day attacks-ts attacks-td attacks-proto attacks-date-severity attacks-month-severity attacks-day-severity attacks-hour-severity attacks-sessionid attacks-srccountry attacks-signature-id attacks-type-signature-id attacks-fortisandbox attacks-httphost attacks-username attacks-httprefer attacks-httpversion threat-weight-client-device attacks-client-device cat-client-device attack-summary attack-details}	Enter zero or more options to indicate which charts based upon attack logs to include in the report. For example, to include “Attacks By Policy,” enter a list of charts that includes attacks-policy. To include “Top Attacked HTTP Methods by Type,” enter a list of charts that includes attacks-method-type.	No default.
report_event_activity {ev-all ev-all-cat ev-all-type ev-crit-hour ev-crit-day ev-warn-hour ev-warn-day ev-info-hour ev-info-day ev-emer-hour ev-emer-	Enter zero or more options to indicate which charts based upon event logs to include in the report. For example, to include “Top Event Categories by Status”, enter a list of charts that includes ev-stat.	No default.

Variable	Description	Default
day ev-aler-hour ev-aler-day ev-err-hour ev-err-day ev-noti-hour ev-noti-day ev-hour ev-hour-cat ev-day ev-day-cat ev-stat ev-day-login ev-week-login ev-user-logint}		
report_traffic_activity {net-pol net-srv net-src net-dst net-src-dst net-dst-src net-date-dst net-hour-dst net-day-dst net-month-dst net-date-src net-hour-src net-day-src net-month-src net-srccountry net-httphost net-username net-httprefer net-httpversion net-client-device}	Enter zero or more options to indicate which charts based upon traffic logs to include in the report. For example, to include “Top Sources By Day of Week”, enter a list of charts that includes net-day-src.	No default.
report_pci_activity {pci-attacks-date-type pci-attacks-month-type pci-attacks-day-type pci-attacks-hour-type}	Enter zero or more options to indicate which charts based upon PCI attack logs to include in the report.	No default.
schedule_type {daily | dates | days | none}	Select when the FortiWeb appliance will automatically run the report. If you reboot the FortiWeb appliance while the report is being generated, report generation resumes after the boot process is complete. If schedule_type is daily, dates or days, specify the schedule_time, schedule_days, or schedule_dates when the report will be generated. If schedule_type is none, the report will be generated only when you manually initiate it.	none
schedule_days {sun | mon | tue | wed | thu | fri | sat}	If schedule_type {daily | dates | days | none} (page 94) is days, select the day of the week when the report should be generated.	No default.
schedule_dates "<dates_str>"	If schedule_type {daily | dates | days | none} (page 94) is dates, select the specific date of the month, from 1 to 31, when the report should be generated. Separate multiple dates with spaces.	No default.
schedule_time "<time_str>"	If schedule_type {daily | dates | days | none} (page 94) is not none, select the time of day when the report	00:00

Variable	Description	Default
	should be run. The time format is `hh:mm`, where: • `hh` is the hour according to a 24-hour clock • `mm` is the minute	
`scope_include_summary {yes | no}`	Enter `yes` to include a summary section at the beginning of the report. The summary includes: • `"<report_name>"` (page 89) • `custom_company "<org_str>"` (page 89) • `report_desc "<comment_str>"` (page 92) • the date and time when the report was generated using this profile • the span of time whose log messages were used to generate the report, according to `period_type {last-14-days | last-2-weeks | last-30-days | last-7-days | lastmonth | last-n-days | last-n-hours | last-n-weeks | last-quarter | last-week | other | this-month | this-quarter | this-week | thiyear | today | yesterday}` (page 92)	`yes`
`scope_include_table_of_content {yes | no}`	Enter `yes` to include a table of contents at the beginning of the report. The table of contents includes links to each chart in the report.	`yes`
`scope_top1 <topX_int>`	Enter **x** number of items (up to 30) to include in the first cross-section of ranked reports. For some report types, you can set the top ranked items for the report. These reports have “Top” in their name, and will always show only the top **x** entries. Reports that do not include “Top” in their name show all information. Changing the values for top field will not affect these reports.	`6`
`scope_top2 <topY_int>`	Enter **y** number of items (up to 30) to include in the second cross-section of ranked reports. For some report types, you can set the number of ranked items to include in the report. These reports have “Top” in their name, and will always show only the top **x** entries. Some report types have two levels of ranking: the top **y** sub-entries for each top **x** entry. Reports that do not include “Top” in their name show all information. Changing the values for top field will not affect these reports.	`3`

Example

This example configures a report to be generated every Saturday at 1 PM. The report, whose title is `Report 1`, includes all available charts, and covers the last 14 days' worth of event, traffic, and attack logs. However, it only uses logs where the source IP address was 192.0.2.20. Each time it is generated, it will be saved to the hard disk in both HTML and PDF file formats and will be sent by email in PDF format to recipients defined within the "Log report analysis" email policy.

```
config log reports
   edit "eport_1"

log sensitive

Use this command to configure whether the FortiWeb appliance will obscure sensitive information, such as user names and passwords, in log messages for which packet payloads are enabled. Each packet payload has predefined sensitivity rules based on the payload data type. If needed, you can also create custom sensitivity rules to obscure other payload data types using `config log custom-sensitive-rule` (page 75).

This command is relevant only if you have enabled the FortiWeb appliance to keep packet payloads along with their associated log messages. For details, see "log attack-log" on page 72 and "log traffic-log" on page 104.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log sensitive
   set type {custom-rule | pre-defined-rule}
end
```

Variable	Description	Default
`type {custom-rule | pre-defined-rule}`	Select whether the FortiWeb appliance will obscure packet payloads according to predefined data types and/or custom data types. For details, see "log custom-sensitive-rule" on page 75.	No default.

Example

This example enables the FortiWeb appliance to use a custom sensitive rule to obscure packet payload information that displays information about users that are age 13 and under.

```
config log sensitive
   set type custom-rule
end
config log custom-sensitive-rule
   edit "custom-sensitive-rule1"
      set type general-mask-rule
      set expression "age\\=[1-13]*$"
   next
end
```

- "log traffic-log" on page 104

log siem-message-policy

Use this command to configure the FortiWeb appliance to send its log messages to one or more a remote ArcSight SIEM (security information and event management) servers.

You must first define one or more SIEM policies using `config log siem-policy` (page 99).

Logs sent to the ArcSight server are controlled by SIEM policies and trigger actions that you configure on the FortiWeb appliance, and are associated with various types of violations.

Logs stored remotely cannot be viewed from the web UI, and cannot be used by FortiWeb to build reports. If you require these features, record logs locally as well as remotely.

Usually, you should set trigger actions for specific types of violations. Failure to do so will result in the FortiWeb appliance logging every occurrence, which could result in high log volume and reduced system performance. Excessive logging for an extended period of time may cause premature hard disk failure.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log siem-message-policy
   set siem-policy "<policy_name>"
   set severity {alert | critical | debug | emergency | error | information |
       notification | warning}
   set status {enable | disable}
end
```

Variable	Description	Default
`siem-policy "<policy_name>"`	Enter the name of an existing SIEM policy to use when storing log information remotely. The maximum length is 63 characters. To view a list of the existing SIEM policies, enter: `set siem-policy ?`	No default.
`severity {alert | critical | debug | emergency | error | information | notification | warning}`	Select the severity level that a log message must meet or exceed in order to cause the FortiWeb appliance to save it to the ArcSight server.	`information`
`status {enable | disable}`	Enable to record event log messages to the ArcSight server if it meets or exceeds the severity level specified by `severity {alert | critical | debug | emergency | error | information | notification | warning}` (page 98).	`disable`

Example

This example enables ArcSight SIEM logging and recording of the log messages. Only the log messages with a severity of `error` or higher are recorded.

```
config log siem-message-policy
   set status enable
   set severity error
   set siem-policy SIEM_Policy1
end
```

Related topics

- "log siem-policy" on page 99

log siem-policy

Use this command to configure a connection to one or more ArcSight SIEM (security information and event management) servers, IBM QRadar servers or Azure Security Center (if your FortiWeb-VM is deployed on Microsoft Azure). The policy is used by the `log syslogd` configuration to define the specific ArcSight server, QRadar server or Azure Event Hub on which log messages are stored. For details, see "log syslogd" on page 101.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log siem-policy
   edit "<policy_name>"
      config siem-server-list
         edit <entry_index>
            set type <arcsight-cef | qradar-leef | azure-cef>
            set port <port_int>
            set server "<siem_ipv4>"
         end
      next
end
```

Variable	Description	Default
`"<policy_name>"`	Enter the name of a new or existing SIEM policy. The maximum length is 63 characters. To display the list of existing policies, enter: `edit ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table.	No default.
`type <arcsight-cef |`	Enter to store log messages to a SIEM (Security	`arcsight-`

Variable	Description	Default
`qradar-leef | azure-cef>`	Information and Event Management) server. According to the specified SIEM policy, FortiWeb will carry out one of the following actions: • `arcsight-cef`—Store log messages remotely to an ArcSight server • `qradar-leef`—Store log messages remotely to a QRadar server • `azure-cef`—Send log messages to Azure Event Hub (only available for FortiWeb-VM installed on Azure) FortiWeb sends log entries in CEF (Common Event Format) format. There is a 256 byte limit for URLs. If this option is enabled, but no trigger action is selected for a specific type of violation, FortiWeb records every occurrence of that violation to the resource specified by **SIEM Policy**. The Azure CEF policy type requires you to complete Azure event hub settings using the `config system eventhub` (page 239) CLI command. **Note:** Before you enable this option, verify that log frequency is not too great. If logs are very frequent, enabling this option can decrease performance and cause the FortiWeb appliance to send many log messages to the resource. **Note:** You cannot view logs stored remotely from the FortiWeb web UI.	`cef`
`port <port_int>`	Enter the port where the ArcSight or QRadar server listens for log output.	`514`
`server "<siem_ipv4>"`	Enter the IP address of the ArcSight or QRadar server.	No default.

Example

This example creates `SIEM_Policy1`. FortiWeb contacts the ArcSight server using its IP address, `192.0.2.10`. Communications occur over the standard port number for ArcSight, UDP port `514`. The FortiWeb appliance sends log messages to the server in CEF format.

```
config log siem-policy
  edit "SIEM_Policy1"
    config siem-server-list
      edit 1
        set type arcsight-cef
        set port 514
        set server "192.0.2.10"
      end
    next
```

```
end
```

log syslogd

Use this command to configure the FortiWeb appliance to send log messages to a Syslog server defined by `config log syslog-policy` (page 102) .

For improved performance, unless necessary, avoid logging highly frequent log types. While logs sent to your Syslog server do not persist in FortiWeb's local RAM, FortiWeb still must use bandwidth and processing resources while sending the log message.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log syslogd
   set status {enable | disable}
   set facility {alert | audit | auth | authpriv | clock | cron | daemon | ftp |
       kernel | local0 | local1 | local2 | local3 | local4 | local5 | local6 | local7 |
       mail | ntp | user}
   set severity {alert | critical | debug | emergency | error | information |
       notification | warning}
   set policy "<syslogd-policy_name>"
end
```

Variable	Description	Default
`status {enable | disable}`	Enable to send log messages to the Syslog server defined by `config log syslog-policy` (page 102). Also configure: • `facility {alert | audit | auth | authpriv | clock | cron | daemon | ftp | kernel | local0 | local1 | local2 | local3 | local4 | local5 | local6 | local7 | mail | ntp | user}` (page 102) • `policy "<syslogd-policy_name>"` (page 102) • `severity {alert | critical | debug | emergency | error | information | notification | warning}` (page 102)	`disable`

Variable	Description	Default
`facility {alert | audit | auth | authpriv | clock | cron | daemon | ftp | kernel | local0 | local1 | local2 | local3 | local4 | local5 | local6 | local7 | mail | ntp | user}`	Enter the facility identifier that the FortiWeb appliance will use to identify itself when sending log messages to the first Syslog server. To easily identify log messages from the FortiWeb appliance when they are stored on the Syslog server, enter a unique facility identifier, and verify that no other network devices use the same facility identifier.	`local7`
`severity {alert | critical | debug | emergency | error | information | notification | warning}`	Select the severity level that a log message must meet or exceed in order to cause the FortiWeb appliance to send it to the first Syslog server.	`information`
`policy "<syslogd-policy_name>"`	If logging to a Syslog server is enabled, enter the name of a Syslog policy which describes the Syslog server to which the log message will be sent. The maximum length is 63 characters. For details about on Syslog policies, see "log syslog-policy" on page 102.	No default.

Example

This example enables storage of log messages with the `notification` severity level and higher on the Syslog server. The network connections to the Syslog server are defined in `Syslog_Policy1`. The FortiWeb appliance uses the facility identifier `local7` when sending log messages to the Syslog server to differentiate its own log messages from those of other network devices using the same Syslog server.

```
config log syslogd
   set status enable
   set severity notification
   set facility local7
   set policy "Syslog_Policy1"
end
```

log syslog-policy

Use this command to configure a connection to one or more Syslog servers. Each policy can specify connections for up to three Syslog servers. The `log syslogd` configuration uses the policy to define the specific Syslog server or servers on which log messages are stored. For details, see `config log syslogd` (page 101).

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log syslog-policy
   edit "<policy_name>"
      config syslog-server-list
         edit <entry_index>
            set csv {enable | disable}
            set port <port_int>
            set server "<syslog_ipv4>"
            set tls {enable | disable}
         end
   next
end
```

Variable	Description	Default
"<policy_name>"	Enter the name of a new or existing Syslog policy. The maximum length is 63 characters. The name of the report profile will be included in the report header. To display the list of existing policies, enter: `edit ?`	No default.
<entry_index>	Enter the index number of the individual entry in the table. You can create up to 3 connections.	No default.
csv {enable | disable}	Enable if the Syslog server requires the FortiWeb appliance to send log messages in comma-separated value (CSV) format, instead of the standard Syslog format.	disable
port <port_int>	Enter the port number on which the Syslog server listens. The valid range is 1–65,535.	514
server "<syslog_ipv4>"	Enter the IP address of the Syslog server.	No default.
tls {enable | disable}	Enables TLS to establish a secure connection between FortiWeband the specified Syslog server for sending log data.	disable

Example

This example creates `Syslog_Policy1`. The Syslog server is contacted by its IP address, `192.168.1.10`. Communications occur over the standard port number for Syslog, UDP port `514`. The FortiWeb appliance sends log messages to the Syslog server in CSV format.

```
config log syslog-policy
   edit "Syslog_Policy1"
```

```
    config log-server-list
      edit 1
        set server "192.168.1.10"
        set port 514
        set csv enable
      end
    next
  end
```

log traffic-log

Use this command to have the FortiWeb appliance record traffic log messages on its local disk. This command also lets you save packet payloads with the traffic logs.

You must enable disk log storage and select log severity levels using `config log disk` (page 77) before any traffic logs are stored on disk.

Packet payloads supplement the log message by providing the actual data associated with the traffic log, which may help you to analyze traffic patterns.

You can view packet payloads in the **Packet Log** column when viewing a traffic logs using the web UI. For details, see the *FortiWeb Administration Guide*:

http://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log traffic-log
  set packet-log {enable | disable}
  set status {enable | disable}
end
```

Variable	Description	Default
`status {enable | disable}`	Enable to record traffic log messages if disk log storage is enabled, and the logs meet or exceed the severity levels selected using `config log disk` (page 77).	`disable`
`packet-log {enable |`	Enable to keep packet payloads stored with their associated	`disable`

Variable	Description	Default
disable}	traffic log message. For details about obscuring sensitive information in packet payloads, see "log sensitive" on page 97.	
message-event {enable | disable}		disable

Example

This example enables disk log storage, sets `information` as the minimum severity level that a log message must achieve for storage, enables recording of traffic logs and retention of all packet payloads along with the traffic logs.

```
config log disk
   set status enable
   set severity information
end
config log traffic-log
   set status enable
   set packet-log enable
end
```

log trigger-policy

Use this command to configure a trigger policy for use in the notification process.

You apply trigger policies to individual conditions that have an associated action and severity, such as attacks and rule violations. A trigger policy has the following components:

- An email policy (contains the details associated with the recipient email account)
- A Syslog policy (contains details required to communicate with the Syslog server)
- A FortiAnalyzer policy (contains the IP address of the remote FortiAnalyzer appliance)

The trigger policy determines whether an email is sent to administrators when a certain condition occurs and whether the log messages associated with the condition are stored on a Syslog server or FortiAnalyzer.

You define the email, Syslog, and FortiAnalyzer policies before you apply the trigger policy to an individual condition. For details, see "log email-policy" on page 79, "log syslog-policy" on page 102, and "log fortianalyzer-policy" on page 85.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
config log trigger-policy
   edit "<trigger-policy_name>"
        set email-policy "<email-policy_name>"
        set syslog-policy "<syslog-policy_name>"
        set analyzer-policy "<fortianalyzer-policy_name>"
        set siem-policy "<siem-policy_name>"
   next
end
```

Variable	Description	Default
`"<trigger-policy_name>"`	Enter the name of a new or existing trigger policy. The maximum length is 63 characters.	No default.
`email-policy "<email-policy_name>"`	Enter the name of the email policy to be used with the trigger policy. The maximum length is 63 characters. If the conditions associated with the trigger policy occur, the email policy determines the recipients of the notification email messages associated with the condition. For details, see "log email-policy" on page 79.	No default.
`syslog-policy "<syslog-policy_name>"`	Enter the name of the Syslog policy to be used with the trigger policy. The maximum length is 63 characters. If the conditions associated with the trigger policy occur, the Syslog policy determines which Syslog server the messages are sent to. For details, see "log syslog-policy" on page 102.	No default.
`analyzer-policy "<fortianalyzer-policy_name>"`	Enter the name of an existing FortiAnalyzer policy to be used with the trigger policy. The maximum length is 63 characters. For details, see "log fortianalyzer-policy" on page 85.	No default.
`siem-policy "<siem-policy_name>"`	Enter the name of an existing SIEM policy to be used with the trigger policy. The maximum length is 63 characters. For details, see "log siem-policy" on page 99.	No default.

Example

This example creates `Trigger_policy1`, which uses `emailpolicy1` to send email notifications about the condition to specific recipients, and `Syslog_Policy1` to submit the log messages to a specific Syslog server.

```
config log trigger-policy
   edit "Trigger_policy1"
      set syslog-policy "Syslog_Policy1"
```

```
      set email-policy "emailpolicy1"
   next
end
```

- "waf http-protocol-parameter-restriction" on page 429
- "waf signature" on page 472

router policy

Use this command to configure policy routes that redirect traffic away from a static route.

For example, you can divert traffic for intrusion protection scanning (IPS). It is also useful if your FortiWeb protects web servers for different customers (for example, the clients of a Managed Security Service Provider).

Policy routes can direct traffic to a specific network interface and gateway based on the packet's source and destination IP address.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `netgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config router policy
   edit <policy_index>
      set iif "<incoming_interface_name>"
      set src "<source_ip>"
      set dst "<destination_ip>"
      set oif "<outgoing_interface_name>"
      set gateway "<router_ip>"
      set priority <priorty_int>
   next
end
```

Variable	Description	Default
`<policy_index>`	Enter the index number of the policy route. The valid range is 0–65,535.	No default.
`"<incoming_interface_name>"`	Enter the name of the interface, such as `port1`, on which FortiWeb receives packets it applies this routing policy to.	No default.
`src "<source_ip>"`	Enter the source IP address and netmask to match, separated with a space.	`0.0.0.0 0.0.0.0`

Variable	Description	Default
	FortiWeb routes matching traffic through the specified interface and gateway.	
`dst "<destination_ip>"`	Enter the destination IP address and netmask to match, separated with a space. FortiWeb routes matching traffic through the specified interface and gateway.	`0.0.0.0 0.0.0.0`
`"<outgoing_interface_name>"`	Enter the name of the interface, such as `port2`, through which FortiWeb routes packets that match the specified IP address information.	No default.
`gateway "<router_ip>"`	Enter the IP address of a next-hop router. A gateway address is not required for the particular routing policies used as static routes in an one-arm topology. Leave this blank for a one-arm network topology.	`0.0.0.0`
`priority <priorty_int>`	Enter a value between 1 and 200 that specifies the priority of the route. When packets match more than one policy route, FortiWeb directs traffic to the route with the lowest value.	`200`

Related topics

- "router static" on page 110
- "router setting" on page 108

router setting

Use this command to change how FortiWeb handles non-HTTP/HTTPS traffic (for example, SSH and FTP) when it is operating in Reverse Proxy mode.

When this setting is disabled (the default) and FortiWeb is operating in Reverse Proxy mode, the appliance drops any non-HTTP/HTTPS traffic.

When this setting is enabled and FortiWeb is operating in Reverse Proxy mode, the appliance handles non-HTTP/HTTPS protocols in the following ways:

- Any non-HTTP/HTTPS traffic destined for a virtual server on the appliance is dropped.
- For any non-HTTP/HTTPS traffic destined for another destination (for example, a back-end server), FortiWeb acts as a router and forwards it based in its destination address.

This command has no effect when FortiWeb is operating in transparent modes, which allow and forward non-HTTP/HTTPS packets by default.

Use this setting only if necessary. For security and performance reasons, if you have a FortiGate with an Internet/public address virtual IP (VIP) that forwards traffic to your FortiWeb, and your FortiWeb is on the same subnet as your web servers, do not use this setting. Instead, configure the VIP to forward:

- only HTTP/HTTPS to FortiWeb, which forwards it to your servers
- specific traffic such as SSH or SFTP directly to your servers

This avoids latency related to an extra hop. It also avoids accidentally forwarding unscanned protocols.

Routing is best effort. Not all protocols may be supported, such as Citrix Receiver (formerly ICA).

FortiWeb appliances are designed to provide in-depth protection specifically for the HTTP and HTTPS protocols. Because of this, when in **Reverse Proxy mode**, by default, FortiWeb **does not forward non-HTTP/HTTPS protocols** to your protected web servers. That is, IP-based forwarding is disabled. Traffic is only forwarded if picked up and scanned by the HTTP Reverse Proxy. This provides a secure default configuration by blocking traffic to services that might have been unintentionally left open and should not be accessible to the general public.

In some cases, however, a web server provides more services, not just HTTP or HTTPS. A typical exception is a server that also allows SFTP and SSH access. In these cases, enable routing to allow FortiWeb to route the non-HTTP/HTTPS traffic to the server using the server's IP address. For HTTP/HTTPS services, direct traffic to the IP address of the FortiWeb virtual server, which forwards requests to the back-end server after inspection.

This command has no equivalent in the web UI.

Use the following commands to retrieve information about current static route values:

```
config router setting
  get route static
end
```

Use the following commands to view the current value of `ip-forward`:

```
config router setting
  get route setting
end
```

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `netgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config router setting
  set ip-forward {enable | disable}
  set ip6-forward {enable | disable}
end
```

Variable	Description	Default
`ip-forward {enable | disable}`	Enable to forward non-HTTP/HTTPS traffic if its IPv4 IP address matches a static route.	`disable`

Variable	Description	Default
`ip6-forward {enable | disable}`	Enable to forward non-HTTP/HTTPS traffic if its IPv6 IP address matches a static route.	`disable`

Example

This example enables forwarding of non-HTTP/HTTPS traffic, based upon whether the IP address matches a route for the web servers' subnet, and regardless of HTTP proxy pickup.

```
config router setting
   set ip-forward enable
end
```

Related topics

- "router static" on page 110
- "router policy" on page 107
- "router all" on page 1

router static

Use this command to configure static routes, including the default gateway.

Static routes direct traffic existing the FortiWeb appliance—you can specify through which network interface a packet will leave, and the IP address of a next-hop router that is reachable from that network interface. The router is aware of which IP addresses are reachable through various network pathways, and can forward those packets along pathways capable of reaching the packets' ultimate destinations.

A default route is a special type of static route. A default route matches all packets, and defines a gateway router that can receive and route packets if no more specific static route is defined for the packet's destination IP address.

During installation and setup, you should have configured at least one static route, a default route, that points to your gateway. You may configure additional static routes if you have multiple gateway routers, each of which should receive packets destined for a different subset of IP addresses.

For example, if a web server is directly attached to one of the network interfaces, but all other destinations, such as connecting clients, are located on distant networks such as the Internet, you might need to add only one route: a default route for the gateway router through which the FortiWeb appliance connects to the Internet.

The FortiWeb appliance examines the packet's destination IP address and compares it to those of the static routes. If more than one route matches the packet, the FortiWeb appliance applies the route with the smallest index number. For this reason, you should give more specific routes a smaller index number than the default route.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `netgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config router static
   edit <route_index>
```

```
      set device "<interface_name>"
      set dst "<destination_ip>"
      set gateway "<router_ip>"
    next
  end
```

Variable	Description	Default
`<route_index>`	Enter the index number of the static route. If multiple routes match a packet, the one with the smallest index number is applied. The valid range is 0–65,535.	No default.
`device "<interface_name>"`	Enter the name of the network interface device, such as `port1`, through which traffic subject to this route will be outbound. The maximum length is 63 characters.	No default.
`dst "<destination_ip>"`	Enter the destination IP address and netmask of traffic that will be subject to this route, separated with a space. To indicate all traffic regardless of IP address and netmask (that is, to configure a route to the default gateway), enter `0.0.0.0 0.0.0.0` or `::/0`.	`0.0.0.0 0.0.0.0`
`gateway "<router_ip>"`	Enter the IP address of a next-hop router. **Caution:** The gateway IP address must be in the same subnet as the interface's IP address. If you change the interface's IP address later, the new IP address must also be in the same subnet as the interface's default gateway address. Otherwise, all static routes and the default gateway will be lost.	`0.0.0.0`

Example

This example configures a default route that forwards all packets to the gateway router `192.0.2.1`, through the network interface named `port1`.

```
config router static
  edit 0
    set dst "0.0.0.0 0.0.0.0"
    set gateway "192.0.2.1"
    set device port1
  next
end
```

server-policy allow-hosts

Use this command to configure protected host groups.

A protected host group contains one or more IP addresses and/or fully qualified domain names (FQDNs). Each entry in the protected host group defines a virtual or real web host, according to the `Host:` field in the HTTP header of requests from clients, that you want the FortiWeb appliance to protect.

For example, if your web servers receive requests with HTTP headers such as:

```
GET /index.php HTTP/1.1
Host: www.example.com
```

you might define a protected host group with an entry of `www.example.com` and select it in the policy. This would reject requests that are not for that host.

A protected hosts group is usually **not** the same as a physical server.

Unlike a physical server, which is a single IP at the network layer, a protected host group should contain **all** network IPs, virtual IPs, and domain names that clients use to access the web server at the application (HTTP) layer.

For example, clients often access a web server via a **public** network such as the Internet. Therefore the protected host group contains domain names, public IP addresses, and public virtual IPs on a network edge router or firewall that are routable from that public network. But the physical server is only the IP address that the FortiWeb appliance uses to forward traffic to the server and, therefore, is often a **private** network address (unless the FortiWeb appliance operates in Offline Protection or either of the transparent modes).

Protected host groups can be used by:

- Policies
- Input rules
- Server protection exceptions
- Start page rules
- Page access rules

- URL access rules
- Allowed method exceptions
- HTTP authentication rules
- Hidden fields rules
- Many others

Rules can use protected host definitions to apply rules only to requests for a protected host. If you do not specify a protected host group in the rule, the rule will be applied based upon other criteria such as the URL, but regardless of the `Host:` field.

Policies can use protected host definitions to block connections that are not destined for a protected host. If you do not select a protected host group in a policy, connections will be accepted or blocked regardless of the `Host:` field.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `traroutegrp` area. For details, see "Permissions" on page 55.

Syntax

```
config server-policy allow-hosts
   edit "<protected-hosts_name>"
      set default-action {allow | deny | deny_no_log}
      config host-list
         edit <protected-host_index>
            set action {allow | deny | deny_no_log}
            set host {"<host_ipv4>" | "<host_fqdn>" | "<host_ipv6>"}
         next
      end
   next
end
```

Variable	Description	Default
`"<protected-hosts_name>"`	Enter the name of a new or existing group of protected hosts. The maximum length is 63 characters. To display the list of existing groups, enter: `edit ?`	No default.
`default-action {allow | deny | deny_no_log}`	Select whether to accept or deny HTTP requests whose `Host:` field does **not** match any of the host definitions that you will add to this protected hosts group.	`allow`
`<protected-host_index>`	Enter the index number of a protected host within its group. Each host-list can contain up to 64 IP addresses and/or fully qualified domain names (FQDNs). The valid range is 1–9,223,372,036,854,775,807.	No default.
`action {allow | deny | deny_no_log}`	Select whether to accept or deny HTTP requests whose `Host:` field matches the host definition in `host {"<host_ipv4>" | "<host_fqdn>" | "<host_ipv6>"}` (page 114).	`allow`

Variable	Description	Default
`host {"<host_ipv4>" | "<host_fqdn>" | "<host_ipv6>"}`	Enter the IP address or FQDN of a virtual or real web host, as it appears in the `Host:` field of HTTP headers, such as `www.example.com`. The maximum length is 255 characters. If clients connect to your web servers through the IP address of a virtual server on the FortiWeb appliance, this should be the IP address of that virtual server **or** any domain name to which it resolves, **not** the actual IP address of the web server. For example, if a virtual server 192.0.2.1/24 forwards traffic to the physical server 192.0.2.155, for protected hosts, you would enter: • `192.0.2.1`, the address of the virtual server • `www.example.com`, the domain name that resolves to the virtual server	No default.

Example

This example configures a protected hosts group named `example_com_hosts` that contains a website's domain names and its IP address in order to match HTTP requests regardless of which form they use to identify the host.

```
config server-policy allow-hosts
   set default-action deny
   edit "example_com_hosts"
      config host-list
         edit 0
            set host "example.com"
         next
         edit 1
            set host "www.example.com"
         next
         edit 2
            set host "10.0.0.1"
         next
      end
   next
end
```

server-policy health

Use this command to configure server health checks.

Tests for server responsiveness (called “server health checks” in the web UI) poll web servers that are members of a server pool to determine their availability before forwarding traffic. Server health checks can use TCP, HTTP/HTTPS, ICMP `ECHO_REQUEST` (`ping`), TCP SSL, or TCP half-open.

The FortiWeb appliance polls the server at the frequency set in the `interval <seconds_int>` (page 117) option. If the appliance does not receive a reply within the timeout period, and you have configured the health check to retry, it attempts a health check again; otherwise, the server is deemed unresponsive. The FortiWeb appliance reacts to unresponsive servers by disabling traffic to that server until it becomes responsive.

If a back-end server will be unavailable for a long period, such as when a server is undergoing hardware repair, it is experiencing extended downtime, or when you have removed a server from the server pool, you can improve the performance of your FortiWeb appliance by disabling the back-end server, rather than allowing the server health check to continue to check for responsiveness. For details, see "server-policy server-pool" on page 161.

To apply server health checks, select them in a server pool configuration. For details, see "server-policy server-pool" on page 161.

To use this command, your administrator account’s access control profile requires either `w` or `rw` permission to the `traroutegrp` area. For details, see "Permissions" on page 55.

Syntax

```
config server-policy health
   edit "<health-check_name>"
      set trigger-policy "<trigger-policy_name>"
      set relationship {and |or}
      configure health-list
         edit <entry_index>
            set type {icmp | tcp | http | https | tcp-ssl | tcp-half-open}
            set timeout <seconds_int>
            set retry-times <retries_int>
            set interval <seconds_int>
            set url-path "<request_str>"
            set method {get | head | post}
            set host "<host_str>"
            set match-type {response-code | match-content | all}
            set response-code {response-code_int}
            set match-content "<match-content_str>"
         next
end
```

Variable	Description	Default
"<health-check_name>"	Enter the name of the server health check. The maximum length is 63 characters.	No default.

Variable	Description	Default
	To display the list of existing server health checks, enter: `edit ?`	
`trigger-policy "<trigger-policy_name>"`	Enter the name of the trigger to apply when the health check detects a failed server (see "log trigger-policy" on page 105). The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
`relationship {and |or}`	• `and`—FortiWeb considers the server to be responsive when it passes all the tests in the list. • `or`—FortiWeb considers the server to be responsive when it passes at least one of the tests in the list.	`and`
`<entry_index>`	Enter the index number of the individual rule in the table. The valid range is 1–16.	No default.
`type {icmp | tcp | http | https | tcp-ssl | tcp-half-open}`	Select either: • `icmp`—Send ICMP type 8 (`ECHO_REQUEST`) and listen for either ICMP type 0 (`ECHO_RESPONSE`) indicating responsiveness, or timeout indicating that the host is not responsive. • `tcp`—Send TCP `SYN` and listen for either TCP `SYN ACK` indicating responsiveness, or timeout indicating that the host is not responsive. • `http`—Send an HTTP request and listen for the code specified by `response-code`, the page content specified by `match-content`, or both the code and the content, or timeout indicating that the host is not responsive. Apply to server pool members only if the **SSL** setting for the member is disabled. • `https`—Send an HTTPS request and listen for the code specified by `response-code`, the page content specified by `match-content`, or both the code and the content, or timeout indicating that the host is not responsive. Apply to server pool members only if the **SSL** setting for the member is enabled.	`ping`

Variable	Description	Default
	• `tcp-ssl`—Send an HTTPS request. FortiWeb considers the host to be responsive if the SSL handshake is successful, and closes the connection once the handshake is complete. This type of health check requires fewer resources than `http` or `https`. Apply to server pool members only if the **SSL** setting for the member is enabled. • `tcp-half-open`—Send TCP `SYN` and listen for either TCP `SYN ACK` indicating responsiveness, or timeout indicating that the host is not responsive. If the response is `SYN ACK`, send TCP `RST` to terminate the connection. This type of health check requires fewer resources from the pool member than `tcp`.	
`timeout <seconds_int>`	Enter the number of seconds which must pass after the server health check to indicate a failed health check. The valid range is 1–10 .	`3`
`retry-times <retries_int>`	Enter the number of times, if any, a failed health check will be retried before the server is determined to be unresponsive. The valid range is 1–10.	`3`
`interval <seconds_int>`	Enter the number of seconds between each server health check. The valid range is from 1–10.	`10`
`url-path "<request_str>"`	Enter the URL, such as `/index.html`, that FortiWeb uses in the HTTP/HTTPS request to verify the responsiveness of the server. If the web server successfully returns this URL, and its content matches the expression specified by `match-content`, FortiWeb considers it to be responsive. Available when `type {icmp | tcp | http | https | tcp-ssl | tcp-half-open}` (page 116) is `http` or `https`.	No default.
`method {get | head | post}`	Specify whether the health check uses the HEAD, GET, or POST method. Available when `type {icmp | tcp | http | https | tcp-ssl | tcp-half-open}` (page 116) is `http` or `https`.	`get`
`host "<host_str>"`	Optionally, enter the HTTP host header name of a specific host.	No default.

Variable	Description	Default
	This is useful if the pool member hosts multiple websites (virtual hosting environment). Available when `type {icmp | tcp | http | https | tcp-ssl | tcp-half-open}` (page 116) is `http` or `https`.	
`match-type {response-code | match-content | all}`	• `response-code`—If the web server successfully returns the URL specified by `url-path` and the code specified by `response-code`, FortiWeb considers the server to be responsive. • `match-content`—If the web server successfully returns the URL specified by `url-path` and its content matches the `match-content` value, FortiWeb considers the server to be responsive. • `all`—If the web server successfully returns the URL specified by `url-path` and its content matches the `match-content` value, and the code specified by `response-code`, FortiWeb considers the server to be responsive. Available when `type {icmp | tcp | http | https | tcp-ssl | tcp-half-open}` (page 116) is `http` or `https`.	`match-content`
`response-code {response-code_int}`	Enter the response code that you require the server to return to confirm that it is available, if `match-type` is `response-code` or `all`. Available when `type {icmp | tcp | http | https | tcp-ssl | tcp-half-open}` (page 116) is `http` or `https`.	`200`
`match-content "<match-content_str>"`	Enter a regular expression that matches the content that must be present in the HTTP reply to indicate proper server connectivity, if `match-type` is `match-content` or `all`. Available when `type {icmp | tcp | http | https | tcp-ssl | tcp-half-open}` (page 116) is `http` or `https`.	No default.

Example

This example configures a server health check that periodically requests the main page of the website, `/index`. If a physical server does not successfully return that page (which contains the word “About”) every 10 seconds (the default),

and fails the check at least three times in a row, FortiWeb considers it unresponsive and forwards subsequent HTTP requests to other physical servers in the server farm.

```
config server-policy health
   edit "status_check1"
      set trigger-policy "notification-servers1"
      configure health-list
         edit 1
            set type http
            set retry-times 3
            set url-path "/index"
            set method get
            set match-type match-content
            set regular About
   next
end
```

server-policy http-content-routing-policy

Use this command to configure HTTP header-based routing.

Instead of dynamically routing requests to a server pool simply based upon load or connection distribution at the TCP/IP layers, as basic load balancing does, you can forward them based on headers in the HTTP layer.

HTTP header-based routes define how FortiWeb routes requests to server pools. They are based on one or more of the following HTTP header elements:

- Host
- URL
- Parameter
- Referer
- Cookie
- Header
- Source IP
- X.509 certificate
- Geo IP

This type of routing can be useful if, for example, a specific web server or group of servers on the back end support specific web applications, functions, or host names. That is, your web servers or server pools are not identical, but specialized. For example:

- 192.0.2.1—Hosts the website and blog
- 192.0.2.2 and 192.0.2.3—Host movie clips and multimedia
- 192.0.2.4 and 192.0.2.5—Host the shopping cart

If you have configured request rewriting, configure HTTP content-based routing using the original request URL and/or `Host:` name, as it appears **before** FortiWeb has rewritten it. For details about rewriting, see "waf url-rewrite url-rewrite-policy" on page 508.

To apply your HTTP-based routes, select them when you configure the server policy. For details, see "server-policy policy" on page 136.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `traroutegrp` area. For details, see "Permissions" on page 55.

Syntax

```
config server-policy http-content-routing-id
   edit "<routing-policy_name>"
      set server-pool "<server-pool_name>"
      config content-routing-match-list
         edit <entry_index>
            set match-object {http-host | http-request | url-parameter | http-referer |
                http-cookie | http-header | source-ip | x509-certificate-Subject | x509-
                certificate-Extension | https-sni | geo-ip}
            set match-condition {match-begin | match-end | match-sub | match-domain |
                match-dir | match-reg | ip-range | ip-range6 | equal}
            set x509-subject-name {E | CN | OU | O | L | ST | C}
            set match-expression "<match-expression_str>"
            set name "<name_str>"
            set name-match-condition {match-begin | match-end | match-sub | match-reg |
                equal}
            set value "<value_str>"
            set value-match-condition {match-begin | match-end | match-sub | match-reg |
                equal}
            set start-ip "<start_ip>"
            set end-ip "<end_ip>"
            set reverse {enable | disable}
            set concatenate {and | or}
            set country-list <country-list_str>
         next
      end
   next
end
```

Variable	Description	Default
`"<routing-policy_name>"`	Enter the name of the HTTP content routing policy. The maximum length is 63 characters. To display the list of existing policies, enter: `edit ?`	No default.
`server-pool "<server-pool_name>"`	Enter the name of the server pool to which FortiWeb forwards traffic when the traffic matches rules in this policy. For details, see "server-policy server-pool" on page 161.	No default.
`<entry_index>`	Enter the index number of the individual rule in the table. The valid	No default.

Variable	Description	Default
	range is 1–9,999,999,999,999,999,999.	
`match-object {http-host | http-request | url-parameter | http-referer | http-cookie | http-header | source-ip | x509-certificate-Subject | x509-certificate-Extension | https-sni | geo-ip}`	Enter the type of object that FortiWeb examines for matching values: • `http-host`—`Host:` field • `http-request`—A URL • `url-parameter`—A URL parameter and value • `http-referer`—`Referer:` field • `http-cookie`—A cookie name and value • `http-header`—A header name and value • `source-ip`—An IPv4 address or address range or IPv6 address or address range • `x509-certificate-Subject`—A specified Relative Distinguished Name (RDN) in the X509 certificate `Subject` field. Also specify `x509-subject-name`. • `x509-certificate-Extension`—Additional fields that the extensions field adds to the X509 certificate • `https-sni`— Select this option so that FortiWeb will forward requests based on the SNI in the SSL handshake. • `geo-ip`— Select this option so that FortiWeb matches against the IP addresses from specified countries.	No default.
`match-condition {match-begin | match-end | match-sub | match-domain | match-dir | match-reg | ip-range | ip-range6 | equal}`	Enter the type of value to match. Values can be a literal value that appears in the object or a regular expression. The value of `match-object {http-host | http-request | url-parameter | http-referer | http-cookie | http-header | source-ip | x509-certificate-Subject | x509-certificate-Extension | https-sni | geo-ip}` (page 121) determines which content types you can specify. If `match-object` is `http-host`, `http-request`, `http-referer`, or `x509-certificate-Extension`: • `match-begin`—The object to match begins with the specified string. • `match-end`—The object to match ends with the specified string. • `match-sub`—The object to match contains the specified string. • `equal`—The object to match is the specified string.	No default.
	If `match-object` is `http-host` only: • `match-domain`—The object to match contains the specified string between the periods in a domain name.	No default.

Variable	Description	Default

	For example, if `match-expression` is `abc`, the condition matches the following hostnames:
	
	`dname1.abc.com`
	`dname1.dname2.abc.com`
	
	However, the same Match Simple String value does not match the following hostnames:
	
	`abc.com`
	`dname.abc`
	
	If `match-object` is `http-request`:
	• `match-dir`—The object to match contains the specified string between delimiting characters (slash) in a domain name.
	
	For example, if `match-expression` is `abc`, the condition matches the following hostnames:
	
	`test.com/abc/`
	`test.com/dir1/abc/`
	
	However, the same `match-string` value does not match the following hostnames:
	
	`test.com/abc`
	`test.abc.com`
	
	If `match-object` is `source-ip`:
	• `ip-range`—The source IP to match is an IPv4 IP address or within a range of IPv4 IP addresses.
	• `ip-range6`—The source IP to match is an IPv6 IP address or within a range of IPv6 IP addresses.
	
	If `match-object` is `http-host`, `http-request`, `http-referer`, `source-ip`, or `x509-certificate-Extension`:
	• `match-reg`—The object to match has a value that matches the specified regular expression.	

`x509-subject-name {E | CN | OU | O | L | ST | C}`	Enter the attribute type to match. Available when `match-object {http-host | http-request | url-parameter | http-referer | http-cookie | http-header | source-ip | x509-`	No default.

Variable	Description	Default
	certificate-Subject | x509-certificate-Extension | https-sni | geo-ip} (page 121) is x509-certificate-Subject.	
match-expression "<match-expression_str>"	Enter a value to match in the object element specified by match-object {http-host | http-request | url-parameter | http-referer | http-cookie | http-header | source-ip | x509-certificate-Subject | x509-certificate-Extension | https-sni | geo-ip} (page 121) and match-condition. Examples: • A literal URL, such as /index.php, that a matching HTTP request contains. • An expression, such as ^/*.php, that matches a URL. **Tip:** When you enter a regular expression using the web UI, you can validate its syntax.	No default.
name "<name_str>"	Enter the name of the object to match. The value can be a literal value or a regular expression. For example, the name of a cookie embedded by traffic controller software on one of the servers. Available only if match-object {http-host | http-request | url-parameter | http-referer | http-cookie | http-header | source-ip | x509-certificate-Subject | x509-certificate-Extension | https-sni | geo-ip} (page 121) is url-parameter, http-cookie, or http-header.	No default.
name-match-condition {match-begin | match-end | match-sub | match-reg | equal}	Enter the type of value to match. The value is specified by name and can be a literal value that appears in the object or a regular expression. • match-begin—The name to match begins with the specified string. • match-end—The name to match ends with the specified string. • match-sub—The name to match contains the specified string. • equal—The name to match is the specified string. • match-reg—The name to match matches the specified regular expression.	No default.
value "<value_str>"	Enter the object value to match. The value can be a literal value or a regular expression.	No default.

Variable	Description	Default
	Available if `match-object {http-host | http-request | url-parameter | http-referer | http-cookie | http-header | source-ip | x509-certificate-Subject | x509-certificate-Extension | https-sni | geo-ip}` (page 121) is `url-parameter`, `http-cookie`, or `http-header`.	
`value-match-condition {match-begin | match-end | match-sub | match-reg | equal}`	Enter the type of value to match. The value is specified by `value` and can be a literal value or a regular expression. • `match-begin`—The value to match begins with the specified string. • `match-end`—The value to match ends with the specified string. • `match-sub`—The value to match contains the specified string. • `equal`—The value to match is the specified string. • `match-reg`—The value to match matches the specified regular expression.	No default.
`start-ip "<start_ip>"`	Enter the first IP address in a range of IP addresses. Available if `match-condition {match-begin | match-end | match-sub | match-domain | match-dir | match-reg | ip-range | ip-range6 | equal}` (page 121) is `ip-range` or `ip-range6`.	No default.
`end-ip "<end_ip>"`	Enter the last IP address in a range of IP addresses. Available if `match-object {http-host | http-request | url-parameter | http-referer | http-cookie | http-header | source-ip | x509-certificate-Subject | x509-certificate-Extension | https-sni | geo-ip}` (page 121) is `source-ip`	No default.
`reverse {enable | disable}`	When enabled, FortiWeb will route requests to the server pool that do not match the specified values for the Match Object.	`disable`
`country-list <country-list_str>`	Select countries where the IP addresses originate.	No default.
`concatenate {and | or}`	Select either: • `and`—A matching request matches this entry in addition to other entries in the HTTP content routing list. • `or`—A matching request matches this entry or other entries in the list.	`and`

Example

This HTTP content routing policy routes requests for `www.example.com/school` to the server pool `school-site`.

The content routing has three rules: one matches the host (`www.example.com`), a second matches the `sessid` cookie, and a third matches the /school URL. In combination, the first and third rules match the request for `www.example.com/school`.

```
config server-policy http-content-routing-policy
   edit "content_routing_policy1"
      set server-pool school-site
      config content-routing-match-list
         edit 1
            set match-condition match-reg
            set match-expression "www.example.com "
         next
         edit 2
            set match-object http-cookie
            set name sessid
            set value "hash[a-fA-F0-7]*"
            set name-match-condition match-reg
            set value-match-condition match-reg
         next
         edit 3
            set match-object http-request
            set match-expression "/school"
         next
      end
   next
end
```

server-policy pattern custom-data-type

Use this command to configure custom data types to augment the predefined data types. You can add custom data types to input rules to define the data type of an input, and to auto-learning profiles to detect valid input parameters.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `traroutegrp` area. For details, see "Permissions" on page 55.

Syntax

```
config server-policy pattern custom-data-type
   edit "<custom-data-type_name>"
      set expression "<regex_pattern>"
   next
end
```

Variable	Description	Default
"<custom-data-type_name>"	Enter the name of the custom data type. The maximum length is 63 characters. To display the list of existing types, enter: `edit ?`	No default.
expression "<regex_pattern>"	Enter a regular expression that defines the data type. It should match all data of that type, but nothing else. The maximum length is 2,071 characters.	No default.

Example

This example configures two custom data types.

```
config server-policy pattern custom-data-type
   edit "Level 3 Password-custom"
      set expression "^aaa"
   next
   edit "Custom Data Type 1"
      set expression "^555"
   next
end
```

Related topics

- "server-policy pattern data-type-group" on page 1

server-policy pattern custom-global-white-list-group

Use this command to configure objects that will be exempt from scans.

When enabled, whitelisted items are **not** flagged as potential problems, nor incorporated into auto-learning data. This feature reduces false positives and improves performance.

To include white list items during policy enforcement and auto-learning reports, you must first disable them in the global white list.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `traroutegrp` area. For details, see "Permissions" on page 55.

Syntax

```
config server-policy pattern custom-global-white-list-group
   edit <entry_index>
      set status {enable | disable}
      set type {Cookie | Parameter | URL}
      set domain "<cookie_fqdn>"
      set name "<name_str>"
      set path "<url_str>"
```

```
        set request-type {plain | regular}
        set request-file "<url_str>"
    next
end
```

Variable	Description	Default
`<entry_index>`	Enter the index number of the individual rule in the table. The valid range is 1–9,223,372,036,854,775,807.	No default.
`status {enable | disable}`	Enable to exempt this object from all scans.	`enable`
`type {Cookie | Parameter | URL}`	Indicate the type of the object. Depending on your selection, the remaining settings vary.	`URL`

`domain "<cookie_fqdn>"`	Enter the partial or complete domain name or IP address as it appears in the cookie, such as:
	`www.example.com`
	`.google.com`
	`192.0.2.50`
	If clients sometimes access the host via IP address instead of DNS, create white list objects for both.
	This setting is available if `type {Cookie | Parameter | URL}` (page 127) is set to `Cookie`.
	Caution: Do not whitelist untrusted subdomains that use vulnerable cookies. It could compromise the security of that domain and its network.
		No default.

`name "<name_str>"`	Depending on your selection in `type {Cookie | Parameter | URL}` (page 127), `either`: • Enter the name of the cookie as it appears in the HTTP request, such as `NID`. • Enter the name of the parameter as it appears in the HTTP URL or body, such as `rememberme`. This setting is available if `type {Cookie | Parameter | URL}` (page 127) is set to `Cookie` or `Parameter`.	No default.
`path "<url_str>"`	Enter the path as it appears in the cookie, such as `/` or `/blog/folder`. This setting is available if `type {Cookie | Parameter | URL}` (page 127) is set to `Cookie`.	No default.
`request-type {plain | regular}`	Indicate whether the `request-file "<url_str>"` (page 128) field contains a literal URL (`plain`), or a regular	`plain`

Variable	Description	Default
	expression designed to match multiple URLs (`regular`). This setting is available if `type {Cookie | Parameter | URL}` (page 127) is set to `URL`.	
`request-file "<url_str>"`	Depending on your selection in the `request-type {plain | regular}` (page 127) field, enter either: • The literal URL, such as `/robots.txt`, that the HTTP request must contain in order to match the rule. The URL must begin with a backslash (/). • A regular expression, such as `^/*.html`, matching all and only the URLs to which the rule should apply. The pattern does not require a slash (/); however, it must at match URLs that begin with a backslash, such as `/index.html`. Do not include the domain name, such as `www.example.com`. This setting is available if `type {Cookie | Parameter | URL}` (page 127) is set to `URL`.	

Example

This example exempts requests for robots.txt from most scans.

```
config server-policy pattern custom-global-white-list-group
   edit 1
      set request-file "/robots.txt"
   next
end
```

server-policy pattern threat-weight

Use this command to configure the global threat weight of security violations. When a security violation is detected, the threat weight of the security violation is used to calculate the reputation of the device that launched the event. Access to networks and servers can be managed according to a device's reputation calculated using the total threat weight of the device.

For details about Threat Weight, see the *FortiWeb Administration Guide*:

http://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config server-policy pattern threat-weight
   set allow-method {off | low | med | high | crit}
   set brute-force-login {off | low | med | high | crit}
   set cookie-security-policy {off | low | med | high | crit}
   set crit <value_int>
   set csrf-protection {off | low | med | high | crit}
   set custom-policy {off | low | med | high | crit}
   set custom-signature {off | low | med | high | crit}
   set dos-protection {off | low | med | high | crit}
   set file-upload-restriction {off | low | med | high | crit}
   set ftp-security {off | low | med | high | crit}
   set geo-ip {off | low | med | high | crit}
   set hidden-field-protection {off | low | med | high | crit}
   set high <value_int>
   set http-protocol-constraints {enable | disable}
   set illegal-json-format {off | low | med | high | crit}
   set illegal-xml-format {off | low | med | high | crit}
   set ip-list {off | low | med | high | crit}
   set ip-reputaton {off | low | med | high | crit}
   set low <value_int>
   set med <value_int>
   set padding-oracle-protection {off | low | med | high | crit}
   set page-access {off | low | med | high | crit}
   set parameter-validation {off | low | med | high | crit}
   set signature {enable | disable}
   set start-pages {off | low | med | high | crit}
   set url-access {off | low | med | high | crit}
   set user-tracking {off | low | med | high | crit}
end
```

Variable	Description	Default
`allow-method {off | low | med | high | crit}`	Set the threat weight for HTTP request method violations.	`med`
`brute-force-login {off | low | med | high | crit}`	Set the threat weight for attempted brute force logins.	`crit`
`cookie-security-policy {off | low | med | high | crit}`	Set the threat weight for cookie poisoning and other cookie-based attacks.	`high`
`crit <value_int>`	Set the value for a critical threat weight. The range of accepted values is 0-100. The value of higher levels must be larger than lower levels.	`50`
`csrf-protection {off`	Set the threat weight for cross-site request forgery attacks.	`high`

Variable	Description	Default
`| low | med | high | crit}`		
`custom-policy {off | low | med | high | crit}`	Set the threat weight for custom policy violations.	`high`
`custom-signature {off | low | med | high | crit}`	Set the threat weight for attack signature and data leak signatures.	`high`
`dos-protection {off | low | med | high | crit}`	Set the threat weight for denial of service (DOS) attacks.	`high`
`file-upload-restriction {off | low | med | high | crit}`	Set the threat weight for violations of upload restriction policies.	`high`
`geo-ip {off | low | med | high | crit}`	Set the threat weight for requests from blocked countries or regions based on the associated source IP address.	`high`
`hidden-field-protection {off | low | med | high | crit}`	Set the threat weight for attempts to tamper with hidden field rules.	`high`
`high <value_int>`	Set the value for a high threat weight. The range of accepted values is 0-100. The value of higher levels must be larger than lower levels.	`30`
`http-protocol-constraints {enable | disable}`	Set to enable threat weights for HTTP protocol constraints. Once enabled, the threat weight for each HTTP protocol constraint may be set using `config waf http-protocol-parameter-restriction` (page 429).	`enable`
`illegal-json-format {off | low | med | high | crit}`	Set the threat weight for illegal formatting in JSON data.	`high`
`illegal-xml-format {off | low | med | high | crit}`	Set the threat weight for illegal XML formatting.	`high`
`ip-list {off | low | med | high | crit}`	Set the threat weight for requests from blacklisted IP addresses.	`high`
`ip-reputaton {off | low | med | high | crit}`	Set the threat weight for requests from IP addresses with a poor reputation.	`crit`
`low <value_int>`	Set the value for a low threat weight. The range of accepted values is 0-100. The value of higher levels must be larger than lower levels.	`5`

Variable	Description	Default
`med <value_int>`	Set the value for a medium threat weight. The range of accepted values is 0-100. The value of higher levels must be larger than lower levels.	`10`
`padding-oracle-protection {off | low | med | high | crit}`	Set the threat weight for padding oracle attacks.	`crit`
`page-access {off | low | med | high | crit}`	Set the threat weight for page order rule violations.	`med`
`parameter-validation {off | low | med | high | crit}`	Set the threat weight for input rule violations.	`high`
`signature {enable | disable}`	Set to enable threat weights for signatures. Once enabled, the threat weight for each signature may be set using `config waf signature` (page 472).	`enable`
`start-pages {off | low | med | high | crit}`	Set the threat weight for start page rule violations.	`med`
`url-access {off | low | med | high | crit}`	Set the threat weight for URL access rule violations.	`med`
`user-tracking {off | low | med | high | crit}`	Set the threat weight for user tracking rule violations.	`med`
`ftp-security {off | low | med | high | crit}`	Set the threat weight for ftp security rule violations.	`med`

Example

This example adjusts the threat weight of DOS attacks.

```
config server-policy pattern threat-weight
   set dos-protection crit
end
```

This example disables signatures.

```
config server-policy pattern threat-weight
   set signature disable
end
```

This example adjusts the risk level value of critical security violations.

```
config server-policy-pattern threat-weight
   set crit 60
end
```

server-policy persistence-policy

Use this command to configure a persistence method and timeout that you can apply to server pools. The persistence policy applies to all members of the server pool.

After FortiWeb has forwarded the first packet from a client to a pool member, some protocols require that subsequent packets also be forwarded to the same back-end server until a period of time passes or the client indicates that it has finished transmission.

To apply a persistence policy, select it when you configure a server pool. For details, see "server-policy server-pool" on page 161.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `traroutegrp` area. For details, see "Permissions" on page 55.

Syntax

```
config server-policy persistence-policy
   edit "<persistence-policy_name>"
      set type { source-ip | persistent-cookie | asp-sessionid | php-sessionid | jsp-
          sessionid | insert-cookie | http-header | url-parameter | rewrite-cookie |
          embedded-cookie | ssl-session-id }
      set cookie-name "<cookie-name_str>"
      set timeout "<timeout_int>"
      set ipv4-netmask "<v4mask>"
      set ipv6-mask-length "<v6mask>"
      set http-header "<http-header_str>"
      set url-parameter "<url-parameter_str>"
      set cookie-path "<cookie-path_str>"
      set cookie-domain "<cookie-domain_str>"
   next
end
```

Variable	Description	Default
`"<persistence-policy_name>"`	Enter the name of the persistence policy. The maximum length is 63 characters. To display the list of existing persistence policies, enter: `edit ?`	No default.
`type { source-ip | persistent-cookie |`	• `source-ip`—Forwards subsequent requests with	`source-ip`

Variable	Description	Default
asp-sessionid | php-sessionid | jsp-sessionid | insert-cookie | http-header | url-parameter | rewrite-cookie | embedded-cookie | ssl-session-id }	the same client IP address and subnet as the initial request to the same pool member. To define how FortiWeb derives the appropriate subnet from the IP address, configure `ipv4-netmask "<v4mask>"` (page 134) and `ipv6-mask-length "<v6mask>"` (page 135). • `persistent-cookie`—If an initial request contains a cookie whose name matches the `cookie-name "<cookie-name_str>"` (page 134) value, FortiWeb forwards subsequent requests that contain the same cookie value to the same pool member as the initial request. • `asp-sessionid`—If a cookie in the initial request contains an ASP .NET session ID value, FortiWeb forwards subsequent requests with the same session ID value to the same pool member as the initial request. FortiWeb preserves the original cookie name. • `php-sessionid`—If a cookie in the initial request contains a PHP session ID value, FortiWeb forwards subsequent requests with the same session ID value to the same pool member as the initial request. FortiWeb preserves the original cookie name. • `jsp_sessionid`—FortiWeb forwards subsequent requests with the same JSP session ID as the inital request to the same pool member. FortiWeb preserves the original cookie name. • `insert-cookie`—FortiWeb inserts a cookie with the name specified by `cookie-name "<cookie-name_str>"` (page 134) to the initial request and forwards all subsequent requests with this cookie to the same pool member. FortiWeb uses this cookie for persistence only and does not forward it to the pool member. Also specify `cookie-path "<cookie-path_str>"` (page 135) and `cookie-domain "<cookie-domain_str>"` (page 135). • `http-header`—Forwards subsequent requests with the same value for an HTTP header as the initial request to the same pool member. Also configure `http-header`.	
	• `url-parameter`—Forwards subsequent requests with the same value for a URL parameter as the initial request to the same pool member.	

Variable	Description	Default
	Also configure `url-parameter`. • `rewrite-cookie`—If the HTTP response has a `Set-Cookie:` value that matches the value specified by `cookie-name "<cookie-name_str>"` (page 134), FortiWeb replaces the value with a randomly generated cookie value. FortiWeb forwards all subsequent requests with this generated cookie value to the same pool member. • `embedded-cookie`—If the HTTP response contains a cookie with the name specified by `cookie-name "<cookie-name_str>"` (page 134), FortiWeb preserves the original cookie value and adds a randomly generated cookie value and a ~ (tilde) as a prefix. FortiWeb forwards all subsequent requests with this cookie and prefix to the same pool member. • `ssl-session-id`—If a cookie in the initial request contains an SSL session ID value, FortiWeb forwards subsequent requests with the same session ID value to the same pool member as the initial request. FortiWeb preserves the original cookie name. For persistence types that use cookies, you can use the `sessioncookie-enforce` setting to maintain persistence for transactions within a session. For details, see "server-policy policy" on page 136.	
`cookie-name "<cookie-name_str>"`	Enter a value to match or the name of the cookie that FortiWeb inserts. Available only when the persistence type uses a cookie.	No default.
`timeout "<timeout_int>"`	Enter the maximum amount of time between requests that FortiWeb maintains persistence, in seconds. FortiWeb stops forwarding requests according to the established persistence after this amount of time has elapsed since it last received a request from the client with the associated property (for example, an IP address or cookie). Instead, it again selects a pool member using the load balancing method specified in the server pool configuration.	`300`
`ipv4-netmask "<v4mask>"`	Enter the IPv4 subnet used for session persistence. For example, if IPv4 Netmask is 255.255.255.255,	`255.255.255.255`

Variable	Description	Default
	FortiWeb can forward requests from IP addresses 192.0.2.1 and 192.0.2.2 to different server pool members. If IPv4 Netmask is 255.255.255.0, FortiWeb forwards requests from IP addresses 192.0.2.1 and 192.0.2.2 to the same pool member.	
`ipv6-mask-length "<v6mask>"`	Enter the IPv6 network prefix used for session persistence.	`128`
`http-header "<http-header_str>"`	Enter the name of the HTTP header that the persistence feature uses to route requests.	No default.
`url-parameter "<url-parameter_str>"`	Enter the name of the URL parameter that the persistence feature uses to route requests.	No default.
`cookie-path "<cookie-path_str>"`	Enter a path attribute for the cookie that FortiWeb inserts, if `type { source-ip | persistent-cookie | asp-sessionid | php-sessionid | jsp-sessionid | insert-cookie | http-header | url-parameter | rewrite-cookie | embedded-cookie | ssl-session-id }` (page 132) is `insert-cookie`.	No default.
`cookie-domain "<cookie-domain_str>"`	Enter a domain attribute for the cookie that FortiWeb inserts, if `type { source-ip | persistent-cookie | asp-sessionid | php-sessionid | jsp-sessionid | insert-cookie | http-header | url-parameter | rewrite-cookie | embedded-cookie | ssl-session-id }` (page 132) is `insert-cookie`.	No default.

Example

This example creates the persistence policy `ip-persistence`. When this policy is applied to a server pool, FortiWeb forwards initial requests from an IP address using the load-balancing algorithm configured for the pool. It forwards any subsequent requests with the same client IP address as the initial request to the same pool member. After FortiWeb has not received a request from the IP address for 400 seconds, it forwards any subsequent initial requests from the IP address using the load-balancing algorithm.

```
config server-policy persistence-policy
  edit "ip-persistence"
    set type source-ip
    set timeout 400
  next
end
```

Related topics

- "server-policy server-pool" on page 161

server-policy policy

Use this command to configure HTTP, FTP, and AD FS server policies.

FortiWeb applies only one server policy to each connection.

HTTP policy behavior varies by the operation mode. FTP and AD FS server policies are available only in Reverse Proxy mode. For details, see *FortiWeb Administration Guide*:

http://docs.fortinet.com/fortiweb/admin-guides

When you switch the operation mode, FortiWeb deletes server policies from the configuration file if they are not applicable in the current operation mode.

To determine which type of server policy to create, configure `protocol {HTTP | FTP | ADFSPIP}` (page 148). If you're planning to configure an FTP server policy, you'll need to confirm that `system feature-visibility` (page 242) is enabled. For details, see "system feature-visibility" on page 242.

Before you configure an HTTP server policy, you can configure several policies and profiles:

- Configure a virtual server and server pool. For details, see "server-policy vserver" on page 189 and "server-policy server-pool" on page 161.
- To route traffic based on headers in the HTTP layer, configure one or more HTTP content routing policies. For details, see "server-policy http-content-routing-policy" on page 119.
- To restrict traffic based upon which hosts you want to protect, configure a group of protected host names. For details, see "server-policy allow-hosts" on page 112.
- If you want the FortiWeb appliance to gather auto-learning data, generate or configure an auto-learning profile and its required components. For details, see "waf web-protection-profile autolearning-profile" on page 1 and "server-policy custom-application application-policy" on page 1.
- If you plan to authenticate users, you need to configure users, user groups, and authentication rules and policy, and include the policy in an inline web protection profile. For details, see "user ldap-user" on page 320, "user local-user" on page 324, "user ntlm-user" on page 325, "user user-group" on page 332, "waf http-authen http-authen-rule" on page 417, and "waf http-authen http-authen-policy" on page 414.
- To apply a web protection profile to a server policy, you must first configure them. For details, see "waf web-protection-profile inline-protection" on page 528 (Reverse Proxy mode or either of the transparent modes), or "waf web-protection-profile offline-protection" on page 541 (Offline Protection mode) .
- If you want to use the FortiWeb appliance to apply SSL to connections instead of using physical servers, you must also import a server certificate or create a Server Name Indication (SNI) configuration. For details, see "system certificate local" on page 219, "system certificate sni" on page 226. , and "system certificate urlcert" on page 228.
- If you want the FortiWeb appliance to verify the certificate provided by an HTTP client to authenticate themselves, you must also define a certificate verification rule. If you want to specify whether a client is required to present a personal certificate or not based on the request URL, create a URL-based client certificate group. For details, see "system certificate verify" on page 229.

You can also use SNMP traps to notify you of policy status changes, or when a policy enforces your network usage policy. For details, see "system snmp community" on page 301.

Before you configure an FTP server policy, you need to:

- Configure an FTP command restriction rule. For details, see "waf ftp-command-restriction-rule" on page 401.
- Configure an FTP file check rule. For details, see "waf ftp-file-security" on page 404.
- Enable IP reputation intelligence. For details, see "waf ip-intelligence" on page 441.
- Create a geo IP rule. For details, see "waf geo-block-list" on page 406.
- Create an IP list. For details, see "waf ip-list" on page 444.
- Configure an FTP security inline profile. For details, see waf ftp-propredefined-global-white-listtection-profile.

Before you configure an AD FS server policy, you need to:

- Configure a virtual server and server pool. For details, see "server-policy vserver" on page 189 and "server-policy server-pool" on page 161."server-policy vserver" on page 189
- Import a certificate file and a CA file. For details, see "system certificate local" on page 219 and "system certificate ca" on page 212.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `traroutegrp` area. For details, see "Permissions" on page 55.

Syntax

```
config server-policy policy
   edit "<policy_name>"
      set allow-hosts "<hosts_name>"
      set block-port <port_int>
      set case-sensitive {enable | disable}
      set certificate "<certificate_name>"
      set client-certificate-forwarding {enable | disable}
      set server-policy policy
      set client-certificate-forwarding-sub-header "<header_str>"
      set client-real-ip {enable | disable}
      set client-timeout <seconds_int>
      set comment "<comment_str>"
      set data-capture-port <port_int>
      set deployment-mode {server-pool | http-content-routing | offline-protection |
          transparent-servers | wccp-servers}
      set ftp-protection-profile <profile_name>
      set half-open-threshold <packets_int>
      set hpkp-header "<hpkp_name>"
      set hsts-header {enable | disable}
      set hsts-max-age <timeout_int>
      set hsts-header {enable | disable}
      set http-header-timeout <seconds_int>
      set http-pipeline {enable | disable}
      set http-to-https {enable | disable}
      set https-service "<service_name>"
      set implicit_ssl {enable | disable}
      set intermediate-certificate-group "<CA-group_name>"
      set internal-cookie-httponly {enable | disable}
      set internal-cookie-secure {enable | disable}
      set monitor-mode {enable | disable}

```

Variable	Description	Default
"<policy_name>"	Enter the name of the policy. The maximum length is 63 characters. To display the list of existing policies,	No default.

Variable	Description	Default
	enter: `edit ?`	
`allow-hosts "<hosts_name>"`	Enter the name of a protected hosts group to allow or reject connections based upon whether the `Host:` field in the HTTP header is empty or does or does not match the protected hosts group. The maximum length is 63 characters. To display the list of existing groups, enter: `edit ?` If you do not select a protected hosts group, FortiWeb accepts pr blocks requests based upon other criteria in the policy or protection profile, but regardless of the `Host:` field in the HTTP header. **Note:** Unlike HTTP 1.1, HTTP 1.0 does **not** require the `Host:` field. The FortiWeb appliance does not block HTTP 1.0 requests because they do not have this field, regardless of whether or not you have selected a protected hosts group.	No default.
`block-port <port_int>`	Enter the number of the physical network interface port that FortiWeb uses to send TCP `RST` (reset) packets when a request violates the policy. The valid range varies by the number of physical ports on the NIC. For example, to send TCP `RST` from `port1`, enter: `set block-port port1` Available only when the operating mode is Offline Protection.	No default.
`case-sensitive {enable | disable}`	Enable to differentiate uniform resource locators (URLs) according to upper case and lower case letters for features that act upon the URLs in the headers of HTTP requests, such as start page rules, black list rules, white list rules, and page access rules.	No default.

Variable	Description	Default
	For example, when enabled, an HTTP request involving `http://www.Example.com/` would **not** match protection profile features that specify `http://www.example.com` (difference highlighted in bold).	
`certificate "<certificate_name>"`	Enter the name of the certificate that FortiWeb uses to encrypt or decrypt SSL-secured connections. The maximum length is 63 characters. To display the list of existing certificates, enter: `edit ?` If `sni {enable | disable}` (page 150) is `enable`, FortiWeb uses a Server Name Indication (SNI) configuration instead of or in addition to this server certificate. For details, see `sni {enable | disable}` (page 150). This option is used only if `https-service "<service_name>"` (page 146) is configured.	No default.
`client-certificate-forwarding {enable | disable}`	Enable to include the X.509 personal certificate presented by the client during the SSL/TLS handshake, if any, in an `X-Client-Cert:` HTTP header when forwarding the traffic to the protected web server. FortiWeb still validates the client certificate itself, but this can be useful if the web server requires the client certificate for the purpose of server-side identity-based functionality.	`disable`
`client-certificate-forwarding-cert-header "<header_str>"`	Enter a custom certificate header that will include the Base64 certificate of the X.509 personal certificate presented by the client during the SSL/TLS handshake when it forwards the traffic to the protected web server.	`x-client-cert`
`client-certificate-forwarding-sub-`	Enter a custom subject header that will include	`x-client-dn`

Variable	Description	Default
`header "<header_str>"`	the subject of the X.509 personal certificate presented by the client during the SSL/TLS handshake when it forwards the traffic to the protected web server.	
`client-real-ip {enable | disable}`	Enter `enable` to configure FortiWeb to use the source IP address of the client that originated the request when it connects to a back-end server on behalf of that client. By default, when the operation mode is Reverse Proxy, the source IP for connections between FortiWeb and back-end servers is the address of a FortiWeb network interface. **Note:** To ensure FortiWeb receives the server's response, configure FortiWeb as the server's gateway. Available only if the operating mode is Reverse Proxy.	`disable`
`client-timeout <seconds_int>`	Enter the amount of time (in seconds) that FortiWeb will keep open a connection with an idle client that isn't sending data. The valid range is 1–1200. A value of 0 means that there is no timeout.	`0`
`comment "<comment_str>"`	Enter a description or other comment. If the comment is more than one word or contains special characters, surround the comment with double quotes ("). The maximum length is 999 characters.	No default.
`data-capture-port <port_int>`	Enter the network interface of incoming traffic that the policy attempts to apply a profile to. The IP address is ignored. Available only if the operating mode is offline inspection.	
`deployment-mode {server-pool | http-content-routing | offline-protection | transparent-servers | wccp-servers}`	Specify the distribution method that FortiWeb uses when it forwards connections accepted by this policy. • `server-pool`—Forwards connections to a server pool.	No default.

Variable	Description	Default
	Depending on the pool configuration, FortiWeb either forwards connections to a single physical server or domain server or distributes the connection among the pool members. Also configure `server-pool "<server-pool_name>"` (page 148). This option is available only if the operating mode is Reverse Proxy mode. • `http-content-routing`—Use HTTP content routing to route HTTP requests to a specific server pool. This option is available only if the FortiWeb appliance is operating in Reverse Proxy mode. • `offline-detection` — Allows connections to pass through the FortiWeb appliance and applies an Offline Protection profile. Also configure `server-pool "<server-pool_name>"` (page 148). This is the only option available if operating mode is Offline Protection. • `transparent-servers`—Allows connections to pass through the FortiWeb appliance and applies a protection profile. Also configure `server-pool "<server-pool_name>"` (page 148). This is the only option available when the operating mode is either True Transparent Proxy or Transparent Inspection. • `wccp-servers`—FortiWeb is a Web Cache Communication Protocol (WCCP) client that receives traffic from a FortiGate configured as a WCCP server. Also configure `server-pool "<server-pool_name>"` (page 148). This is the only option available when the operation mode is WCCP.	
`ftp-protection-profile <profile_name>`	Enter the FTP security profile to apply to connections that this policy monitors. If you haven't created a profile yet, see waf ftp-propredefined-global-white-listtection-profile or instructions about creating one.	No default.

Variable	Description	Default
`half-open-threshold <packets_int>`	Enter the maximum number of TCP `SYN` packets, including retransmission, that FortiWeb allows to be sent per second to a destination address. If this threshold is exceeded, the FortiWeb appliance treats the traffic as a DoS attack and ignores additional traffic from that source address. The valid range is 10–10,000. Available only when the operating mode is Reverse Proxy or True Transparent Proxy and `syncookie {enable | disable}` (page 155) is enabled.	`8192`
`hpkp-header "<hpkp_name>"`	Select an HPKP profile, if any, to use to verify certificates when clients attempt to access a server. HPKP prevents attackers from carrying out *Man in the Middle* (MITM) attacks with forged certificates. Available only when the operating mode is Reverse Proxy.	No default.
`hsts-header {enable | disable}`	Enable to combat MITM attacks on HTTP by injecting the RFC 6797 (http://tools.ietf.org/html/rfc6797) strict transport security header into the reply, such as: `Strict-Transport-Security: max-age=31536000; includeSubDomains` This header forces the client to use HTTPS for subsequent visits to this domain. If the certificate does not validate, it also causes a fatal connection error: the client's web browser does not display any dialog that allows the user to override the certificate mismatch error and continue. Available only if `https-service "<service_name>"` (page 146) is configured.	`disable`
`hsts-max-age <timeout_int>`	Enter the time to live in seconds for the	`7776000`

Variable	Description	Default
	HSTS header. Available only if `hsts-header {enable | disable}` (page 143) is enabled. The valid range is 3,600–31,536,000.	
`http2 {enable | disable}`	FortiWeb's HTTP/2 security inspection is only supported for Revers Proxy mode and True Transparent Proxy mode. This option enables FortiWeb operating in **Reverse Proxy** mode (see `opmode {offline-protection | reverse-proxy | transparent | transparent-inspection | wccp}` (page 300)) to negotiate HTTP/2 with clients via SSL ALPN (Application-Layer Protocol Negotiation) during the SSL handshake if the client's browser supports HTTP/2 protocol. With the HTTP/2 being enabled, FortiWebcan recognize HTTP/2 traffic and apply the security services to it. To enable HTTP/2 communication between the FortiWeb and back-end web servers for HTTP/2 inspections in Reverse Proxy mode, see `http2 {enable | disable}` (page 171). Available only when `opmode` is set to `reverse-proxy`, `deployment-mode {server-pool | http-content-routing | offline-protection | transparent-servers | wccp-servers}` (page 141) is set to `server-pool` and `https-service "<service_name>"` (page 146) is set correctly. FortiWeb supports HTTP/2 only for HTTPS connections and HTTP Content Routing is not supported for HTTP/2. When `opmode` is set to `transparent` and `deployment-mode` is set to `transparent-servers`, this is not available. It only requires `http2 {enable | disable}` (page 171) to enable the HTTP/2 security inspections in	disable

Variable	Description	Default
	True Transparent Proxy mode; this option here is not required. For more details about HTTP/2 support, see the FortiWeb Administration Guide: http://docs.fortinet.com/fortiweb/admin-guides	
`http-header-timeout <seconds_int>`	Enter the amount of time (in seconds) that FortiWeb will wait for the whole HTTP request header after a client sets up a TCP connection. The valid range is 0–1200. A value of 0 means that there is no timeout.	`0`
`http-pipeline {enable | disable}`	Specify whether FortiWeb accelerates transactions by bundling them inside the same TCP connection, instead of waiting for a response before sending/receiving the next request. This can increase performance when pages containing many images, scripts, and other auxiliary files are all hosted on the same domain, and therefore logically could use the same connection. When FortiWeb is operating in Reverse Proxy or True Transparent Proxy mode, it can automatically use HTTP pipelining for requests with the following characteristics: • HTTP version is 1.1 • The Connection general-header field does not include the "close" option (for example, `Connection: close`) • The HTTP method is `GET` or `HEAD`	`enable`
`http-to-https {enable | disable}`	Specify enable to automatically redirect all HTTP requests to the HTTPS service with the same URL and parameters. Also configure https-service and ensure service uses port 443 (the default). FortiWeb does not apply the protection profile for this policy (specified by `web-protection-profile "<profile_name>"` (page 158)) to the redirected	`disable`

Variable	Description	Default
	traffic. Available only when the operation mode is Reverse Proxy.	
`https-service "<service_name>"`	Enter the custom or predefined service that defines the port number on which the virtual server receives HTTPS traffic. The maximum length is 63 characters. To display the list of existing services, enter: `edit ?` Available only when the operating mode is Reverse Proxy. For other operation modes, use the server pool configuration to enable SSL inspection instead.	No default.
`intermediate-certificate-group "<CA-group_name>"`	Enter the name of an intermediate certificate authority (CA) group, if any, that FortiWeb uses to validate the CA signing chain in a client's certificate. The maximum length is 63 characters. To display the list of existing groups, enter: `edit ?` Available only if `https-service "<service_name>"` (page 146) is configured.	No default.
`internal-cookie-httponly {enable | disable}`	Enable to assign an `httponly` flag to internal cookies. This feature is independent of the Cookie Security policy, if any, that you have in use.	`enable`
`internal-cookie-secure {enable | disable}`	Enable to assign a `secure` flag to internal cookies. This flag can only be assigned if the connection is over SSL. This feature is independent of the Cookie Security policy, if any, that you have in use.	`disable`
`monitor-mode {enable | disable}`	Enable to override deny and redirect actions defined in the server protection rules for the selected policy. This setting enables FortiWeb to log attacks without	`disable`

Variable	Description	Default
	performing the deny or redirect action. Disable to allow FortiWeb to perform attack deny/redirect actions as defined by the server protection rules.	
`noparse {enable | disable}`	Enable this option to apply the server policy as a pure proxy, without parsing the content. In this case, the policy allows all traffic to pass through the FortiWeb appliance without applying any protection rules. See also "debug application http" on page 583 and "debug flow trace" on page 598. This option applies to server policy only when the FortiWeb appliance operates in Reverse Proxy or True Transparent Proxy mode. **Caution:** Use this only during debugging and for as brief a period as possible. This feature disables many protection features. See also `http-parse-error-output {enable | disable}` (page 73).	`disable`
`ocspstapling {enable | disable}`	Enable OCSP stapling for the certificate you specified in `certificate "<certificate_name>"` (page 140). This option is available only if `https-service "<service_name>"` (page 146) is configured.	`disable`
`ocspstapling-group "<group_name>"`	Enter the custom OCSP group that defines the CA certificate and URL of the OCSP server corresponding to the certificate specified in `certificate "<certificate_name>"` (page 140). For details, see "system certificate remote" on page 224. This option is available only if `ocspstapling {enable | disable}` (page 147) is set to `enable`.	No default.
`policy-id`	A 64-bit random integer assigned to each server policy. The `policy-id` is a unique	No default.

Variable	Description	Default
	identification number for each server policy. When administrative domains (ADOMs) are enabled, ADOMs can create unique server policies with policy names that are identical to other server policies created by different ADOMs, so the `policy-id` can easily differentiate between different policies created by different ADOMs that may share the same policy name.	
`prefer-current-session {enable |disable}`	Enable to forward subsequent requests from an identified client connection to the same server pool as the initial connection from the client. This option allows FortiWeb to improve its performance by skipping the process of matching HTTP header content to content routing policies for connections it has already evaluated and routed. Available only when `deployment-mode {server-pool | http-content-routing | offline-protection | transparent-servers | wccp-servers}` (page 141) is `http-content-routing`.	`disable`
`protocol {HTTP | FTP | ADFSPIP}`	Select one of the following: • `HTTP`—Specifies that the server policy governs HTTP traffic. Specific options for configuring an HTTP server policy become available. • `FTP`—Specifies that the server policy governs FTP traffic. Specific options for configuring an FTP server policy become available. • `ADFSPIP`—Specifies that the server policy governs AD FS traffic. Specific options for configuring an AD FS server policy become available.	`HTTP`
`server-pool "<server-pool_name>"`	Enter the name of the server pool whose members receive the connections. To display the list of existing servers,	No default.

Variable	Description	Default
	enter: `edit ?` This field is applicable only if `deployment-mode {server-pool | http-content-routing | offline-protection | transparent-servers | wccp-servers}` (page 141) is `server-pool`, `offline-protection` or `transparent-servers`. **Caution:** Multiple virtual servers/policies can forward traffic to the same server pool. If you do this, consider the total maximum load of connections that all virtual servers forward to your server pool. This configuration can multiply traffic forwarded to your server pool, which can overload it and cause dropped connections.	
`service "<service_name>"`	Enter the custom or predefined service that defines the port number on which the virtual server receives HTTP traffic. The maximum length is 63 characters. To display the list of existing services, enter: `edit ?` Available only when the operating mode is Reverse Proxy.	No default.
`sessioncookie-enforce {enable | disable}`	• `enable`—When FortiWeb maintains session persistence using cookies, it inserts a cookie in subsequent transactions in a session if the transaction does not contain a control cookie. This option is useful if your environment uses TCP multiplexing, which combines HTTP requests from multiple clients in a single session for load balancing or other purposes. • `disable`—When FortiWeb maintains session persistence using cookies, it tracks or inserts the cookie for the first transaction of	`disable`

Variable	Description	Default
	a session only. It does not track or insert a cookie in subsequent transactions in the session, even if the transaction does not contain a control cookie. For details about configuring session persistence, see "server-policy persistence-policy" on page 132.	
`server-side-sni {enable | disable}`	Specify whether FortiWeb supports Server Name Indication (SNI) for back-end servers that it applies this policy to. Enable this feature when the operating mode is Reverse Proxy, end-to-end encryption is required, and the back-end web server itself requires SNI support. When the operating mode is Reverse Proxy, True Transparent Proxy, or WCCP, you enable server-side SNI support using server pool configuration.	`disable`
`sni {enable | disable}`	Enable to use a Server Name Indication (SNI) configuration instead of or in addition to the server certificate specified by `certificate <certificate_name>`. The SNI configuration enables FortiWeb to determine which certificate to present on behalf of the members of a pool based on the domain in the client request. For details, see "system certificate sni" on page 226. If you specify both a SNI configuration and a certificate, FortiWeb uses the certificate specified by `certificate "<certificate_name>"` (page 140) when the requested domain does not match a value in the SNI configuration. If you enable `sni-strict {enable | disable}` (page 151), FortiWeb always ignores the value of `certificate "<certificate_name>"` (page 140). Available only if `https-service "<service_name>"` (page 146) is	`disable`

Variable	Description	Default
	configured.	
`sni-certificate "<sni_name>"`	Enter the name of the Server Name Indication (SNI) configuration that specifies which certificate FortiWeb uses when encrypting or decrypting SSL-secured connections for a specified domain. The SNI configuration enables FortiWeb to present different certificates on behalf of the members of a pool according to the requested domain. If only one certificate is required to encrypt and decrypt traffic that this policy applies to, specify `certificate "<certificate_name>"` (page 140) instead. Available only if `https-service "<service_name>"` (page 146) is configured.	No default.
`sni-strict {enable | disable}`	Select to configure FortiWeb to ignore the value of `certificate "<certificate_name>"` (page 140) when it determines which certificate to present on behalf of server pool members, even if the domain in a client request does not match a value in the specified SNI configuration.	`disable`
`ssl {enable | disable}`	Enable so that connections between clients and FortiWeb use SSL/TLS. Enabling `ssl` will allow you to configure additional SSL options and settings, including specifying supported SSL protocols and uploading certificates.	`disable`
`ssl-cipher {medium | high | custom}`	Specify whether the set of cipher suites that FortiWeb allows creates a medium-security, high-security, or custom configuration. If custom, also specify `ssl-custom-cipher`. This is not allowed to set to `custom` if `http2` is set to `enable`.	`medium`

Variable	Description	Default
	For details, see the *FortiWeb Administration Guide*: http://docs.fortinet.com/fortiweb/admin-guides Available only if `https-service "<service_name>"` (page 146) is configured.	
`ssl-client-verify "<verifier_name>"`	Enter the name of a certificate verifier, if any, to use when an HTTP client presents their personal certificate. If you do not select one, the client is not required to present a personal certificate. If the client presents an invalid certificate, the FortiWeb appliance does not allow the connection. To be valid, a client certificate must: • Not be expired • Not be revoked by either the certificate revocation list (CRL) (see "system certificate verify" on page 229) • Be signed by a certificate authority (CA) whose certificate you have imported into the FortiWeb appliance; if the certificate has been signed by a chain of intermediate CAs, those certificates must be included in an intermediate CA group (see `intermediate-certificate-group "<CA-group_name>"` (page 146)) • Contain a `CA` field whose value matches the CA certificate • Contain an `Issuer` field whose value matches the `Subject` field in the CA certificate Personal certificates, sometimes also called user certificates, establish the identity of the person connecting to the website. You can require that clients present a certificate alternatively or in addition to HTTP authentication. For details, see the *FortiWeb Administration Guide*:	No default.

Variable	Description	Default
	http://docs.fortinet.com/fortiweb/admin-guides The maximum length is 63 characters. To display the list of existing verifiers, type: `edit ?` This option is used only if `https-service "<service_name>"` (page 146) is configured. The client must support TLS 1.0, TLS 1.1, or TLS 1.2.	

`ssl-custom-cipher {<cipher_1> <cipher2> <cipher3> ...}`	Specify one or more cipher suites that FortiWeb allows.
	
	Separate the name of each cipher with a space. To remove from or add to the list of ciphers, retype the entire list.
	
	Valid values are:
	
	`ECDHE-ECDSA-AES256-GCM-SHA384`
	`ECDHE-RSA-AES256-GCM-SHA384`
	`DHE-DSS-AES256-GCM-SHA384`
	`DHE-RSA-AES256-GCM-SHA384`
	`ECDHE-ECDSA-CHACHA20-POLY1305`
	`ECDHE-RSA-CHACHA20-POLY1305`

Variable	Description	Default
	ECDHE-RSA-AES128-SHA256 DHE-RSA-AES128-SHA256 DHE-DSS-AES128-SHA256 ECDHE-ECDSA-CAMELLIA128-SHA256 ECDHE-RSA-CAMELLIA128-SHA256 DHE-RSA-CAMELLIA128-SHA256 DHE-DSS-CAMELLIA128-SHA256 ECDHE-ECDSA-AES256-SHA ECDHE-RSA-AES256-SHA DHE-RSA-AES256-SHA DHE-DSS-AES256-SHA DHE-RSA-CAMELLIA256-SHA DHE-DSS-CAMELLIA256-SHA ECDHE-ECDSA-AES128-SHA ECDHE-RSA-AES128-SHA DHE-RSA-AES128-SHA DHE-DSS-AES128-SHA DHE-RSA-CAMELLIA128-SHA DHE-DSS-CAMELLIA128-SHA AES256-GCM-SHA384 AES256-CCM8 AES256-CCM AES128-GCM-SHA256 AES128-CCM8 AES128-CCM AES256-SHA256 CAMELLIA256-SHA256 AES128-SHA256 CAMELLIA128-SHA256 AES256-SHA CAMELLIA256-SHA AES128-SHA CAMELLIA128-SHA DHE-RSA-SEED-SHA ECDHE_RSA_DES_CBC3_SHA DES_CBC3_SHA	ECDHE-RSA-AES256-SHA ECDHE-ECDSA-AES128-SHA ECDHE-RSA-AES128-SHA AES256-GCM-SHA384 AES128-GCM-SHA256 AES256-SHA256 AES128-SHA256
ssl-noreg {enable | disable}	Specify whether FortiWeb ignores requests from clients to renegotiate TLS or SSL. Protects against denial-of-service (DoS) attacks that use TLS/SSL renegotiation to overburden the server. Available only if https-service "<service_name>" (page 146) is configured.	enable
ssl-session-timeout <ssl-session-timeout_int>	When FortiWeb is configured as an SSL server, you can set SSL session timeout intervals via the CLI. This is available only in	No default.

Variable	Description	Default
	Reverse Proxy and True Transparent Proxy modes.	
`status {enable | disable}`	Enable to allow the policy to be used when evaluating traffic for a matching policy. **Note:** You can use SNMP traps to notify you of changes to the policy's status. For details, see "system snmp community" on page 301.	No default.
`syncookie {enable | disable}`	Enable to detect TCP `SYN` flood attacks. For details, see the *FortiWeb Administration Guide*: http://docs.fortinet.com/fortiweb/admin-guides Available only when the operating mode is Reverse Proxy or True Transparent Proxy.	`disable`
`tcp-recv-timeout <seconds_int>`	Enter the amount of time (in seconds) that FortiWeb will wait for a client to send a request after the client sets up a TCP connection. The valid range is 0–300. A value of 0 means that there is no timeout.	`0`
`tls-v10 {enable | disable}`	Specifies whether clients can connect securely to FortiWeb using the TLS 1.0 cryptographic protocol. This must be set to `disable` if `http2 {enable | disable}` (page 144) is set to `enable`. Available only if `https-service "<service_name>"` (page 146) is configured.	`enable`
`tls-v11 {enable | disable}`	Specifies whether clients can connect securely to FortiWeb using the TLS 1.1 cryptographic protocol. This must be set to `disable` if `http2 {enable | disable}` (page 144) is set to `enable`.	`enable`

Variable	Description	Default
	Available only if `https-service "<service_name>"` (page 146) is configured.	
`tls-v12 {enable | disable}`	Specifies whether clients can connect securely to FortiWeb using the TLS 1.2 cryptographic protocol. Available only if `https-service "<service_name>"` (page 146) is configured.	`enable`
`urlcert {enable | disable}`	Specifies whether FortiWeb uses a URL-based client certificate group to determine whether a client is required to present a personal certificate. Available only if `https-service "<service_name>"` (page 146) is configured.	`disable`
`urlcert-group "<urlcert-group_name>"`	Enter the URL-based client certificate group that determines whether a client is required to present a personal certificate. If the URL the client requests does not match an entry in the group, the client is not required to present a personal certificate. For details about creating a group, see "system certificate urlcert" on page 228.	No default.
`urlcert-hlen <len_int>`	Specifies the maximum allowed length for an HTTP request with a URL that matches an entry in the URL-based client certificate group, in kilobytes. FortiWeb blocks any matching requests that exceed the specified size. This setting prevents a request from exceeding the maximum buffer size. The valid range is 16–128.	No default.
`vserver "<vserver_name>"`	Enter the name of a virtual server that provides the IP address and network interface of incoming traffic that FortiWeb routes and to which the policy applies a	No default.

Variable	Description	Default
	protection profile. The maximum length is 63 characters. To display the list of existing virtual servers, enter: `edit ?` Available only if the operating mode is Reverse Proxy.	
`v-zone "<bridge_name>"`	Enter the name of the bridge that specifies the network interface of the incoming traffic that the policy applies a protection profile to. The maximum length is 15 characters. To display the list of existing bridges, enter: `edit ?` Available only if the operating mode is True Transparent Proxy or Transparent Inspection.	No default.
`waf-autolearning-profile "<profile_name>"`	Enter the name of the auto-learning profile, if any, to use to discover attacks, URLs, and parameters in your web servers' HTTP sessions. The maximum length is 63 characters. To display the list of existing profiles, enter: `edit ?` You can view data gathered using an auto-learning profile in an auto-learning report and use it to generate inline or Offline Protection profiles. For details, see the *FortiWeb Administration Guide*: http://docs.fortinet.com/fortiweb/admin-guides This option appears only if `deployment-mode {server-pool | http-content-routing | offline-protection | transparent-servers | wccp-servers}` (page 141) is `offline-detection`.	No default.

Variable	Description	Default
`web-protection-profile "<profile_name>"`	Enter the name of the web protection or detection profile to apply to connections that this policy accepts. The maximum length is 63 characters. To display the list of existing profiles, enter: `edit ?`	No default.
	Note: If the connection fails when you have selected a certificate verifier, verify that the certificate meets the web browser's requirements. Web browsers may have their own certificate validation requirements in addition to FortiWeb requirements. For example, personal certificates for client authentication may be required to either: • Not be restricted in usage/purpose by the CA, or • Contain a `Key Usage` field that contains `Digital Signature` or have a `ExtendedKeyUsage` or `EnhancedKeyUsage` field whose value contains `Client Authentication` If the certificate does **not** satisfy browser requirements, although it may be installed in the browser, when the FortiWeb appliance requests the client's certificate, the browser may not display a certificate selection dialog to the user, or the dialog may not contain that certificate. In that case, verification fails. For browser requirements, see your web browser's documentation.	
`<entry_index>`	Enter the index number of the individual entry in the table.	No default.
`content-routing-policy-name "<content-routing_name>"`	Enter the name of a HTTP content routing policy that this server policy uses. To display the list of existing error pages, enter: `edit ?`	No default.

Variable	Description	Default
`is-default {yes | no}`	Enter `yes` to specify that FortiWeb applies the protection profile to any traffic that does not match conditions specified in the HTTP content routing policies.	No default.
`profile-inherit {enable | disable}`	Enter `enable` to specify that FortiWeb applies the web protection profile for the server policy to connections that match the routing policy.	`disable`
`implicit_ssl {enable | disable}`	Enable so that FortiWeb will communicate with the pool member using implicit SSL.	No default.
`ssl-quiet-shutdown {enable | disable}`	For HTTPS connection, when disabled, FortiWeb sends ssl alert message to the client or server pool first, and then FIN. When enabled, FortiWeb directly sends FIN message instead of sending ssl alert message.	`disable`
`traffic-mirror {enable | disable}`	Enable to send traffic to third party IPS/IDS devices through network interfaces for traffic monitoring. Available only when "protocol {HTTP | FTP | ADFSPIP}" on page 148 is `HTTP`.	`disable`
`traffic-mirror-profile <traffic-mirror-profile_str>`	Select the mirror policy created.	No default.
`traffic-mirror-type {client-side | server-side| both-side}`	Select the traffic mirror type. For True Transparent Proxy mode, only Client Side type is available, which only allows traffic from client side to be sent to IPS/IDS devices. For Reverse Proxy mode, you can select Client Side, Server Side, or Client and Server.	No default.
`multi-certificate {enable | disable}`	Enable to allow FortiWeb to use multiple local certificates.	`disable`
`adfs-certificate-service <adfs-certificate-service_str>}`	Configure this option if the AD FS server requires client certificate for authentication. Select the pre-defined service **TLSCLIENTPORT** if FortiWeb uses service port 49443 to listen the certification authentication requests.	No default.
`adfs-certificate-ssl-client-verify <adfs-certificate-ssl-client-verify_str>}`	Select the certificate validation rule you have created.	No default.

Variable	Description	Default
`certificate-group <certificate-group_str>}`	Select the multi-certificate file you have created.	No default.

Example

This example configures a web protection server policy. FortiWeb forwards HTTPS connections received by the virtual server named `virtual_ip1` to a server pool named `apache1`, which contains a single physical server. FortiWeb uses the certificate named `certificate1` during SSL negotiations with the client, then forwards traffic to the server pool.

```
config server-policy policy
   edit "https-policy"
      set deployment-mode server-pool
      set vserver "virtual_ip1"
      set server-pool "apache1"
      set web-protection-profile "inline-protection1"
      set https-service HTTPS
      set certificate "certificate1"
      set ssl-client-verify
      set case-sensitive disable
      set status enable
   next
end
```

server-policy server-pool

Use this command to configure an HTTP, FTP, or AD FS server pool.

Server pools define a group of one or more physical or domain servers (web servers) that FortiWeb distributes connections among, or where the connections pass through to, depending on the operation mode. Reverse Proxy mode actively distributes connections; Offline Protection and either of the transparent modes do not actively distribute connections.

To apply the server pool configuration, do one of the following:

- Select it in a server policy directly.
- Select it in an HTTP content writing policy that you can, in turn, select in a server policy.

For details, see "server-policy policy" on page 136 and "server-policy http-content-routing-policy" on page 119.

To determine which type of server policy to create, configure `protocol {HTTP | FTP | ADFSPIP}` (page 165). If you're planning to configure an FTP server policy, you'll need to confirm that `system feature-visibility` (page 242) is enabled. For details, see "system feature-visibility" on page 242.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `traroutegrp` area. For details, see "Permissions" on page 55.

Syntax

```
config server-policy server-pool
   edit "<server-pool_name>"
      set comment "<comment_str>"
      set health "<health-check_name>"
      set http-reuse {aggressive | always | never | safe}
      set lb-algo {least-connections | round-robin | weighted-round-robin | uri-hash |
          full-uri-hash | host-hash | host-domain-hash | src-ip-hash}
      set persistence "<persistence-policy_name>"
      set protocol {HTTP | FTP | ADFSPIP}
      set reuse-conn-idle-time <int>
      set reuse-conn-max-count <int>
      set reuse-conn-max-request <int>
      set reuse-conn-total-time <int>
      set server-balance {enable | disable}
      set server-pool-id
      set type {offline-protection | reverse-proxy | transparent-servers-for-ti |
          transparent-servers-for-tp | transparent-servers-for-wccp}
      config pserver-list
         edit <entry_index>
            set analyzer-policy "<fortianalyzer-policy_name>"
            set backup-server {enable | disable}
            set certificate "<certificate_name>"
            set certificate-verify "<verifier_name>"
            set client-certificate "<client-certificate_name>"
            set client-certificate-forwarding {enable | disable}
            set client-certificate-forwarding-cert-header "<header_str>"
            set client-certificate-forwarding-sub-header "<header_str>"
            set client-certificate-proxy {enable | disable}
            set client-certificate-proxy-sign-ca <sign_ca>
            set conn-limit <conn-limit_int>
```

```
            set domain "<server_fqdn>"
            set health-check-inherit {enable | disable}
            set hlck-domain <hlck-domain_str>
            set hpkp-header "<hpkp_name>"
            set hsts-header {enable | disable}
            set hsts-max-age <timeout_int>
            set http2 {enable | disable}
            set implicit_ssl {enable | disable}
            set intermediate-certificate-group "<CA-group_name>"
            set ip {"address_ipv4" | "address_ipv6"}
            set ocspstapling {enable | disable}
            set ocspstapling-group "<group_name>"
            set port <port_int>
            set server-certificate-verify {enable | disable}
            set server-certificate-verify-action {alert | alert_deny | redirect}
            set server-certificate-verify-policy "<policy_name>"
            set recover <recover_int>
            set server-side-sni {enable | disable}
            set server-type {physical | domain}
            set session-id-reuse {enable | disable}
            set session-ticket-reuse {enable | disable}
            set sni {enable | disable}
            set sni-certificate "<sni_name>"
            set sni-strict {enable | disable}
            set ssl {enable | disable}
            set ssl-cipher {medium | high | custom}
            set ssl-custom-cipher {<cipher_1> <cipher2> <cipher3> ...}
            set ssl-noreg {enable | disable}
            set ssl-quiet-shutdown {enable | disable}
            set ssl-session-timeout <ssl-session-timeout_int>
            set status {disable |enable | maintain}
            set tls-v10 {enable | disable}
            set tls-v11 {enable | disable}
            set tls-v12 {enable | disable}
            set url-cert {enable | disable}
            set urlcert-group "<urlcert-group_name>"
            set urlcert-hlen <len_int>
            set warm-rate <warm-rate_int>
            set  warm-up <warm-up_int>
            set weight <weight_int>
            set adfs-domain <adfs-domain_str>
            set adfs-username <adfs-username_str>
            set adfs-password <adfs-password_str>
            set multi-certificate {enable | disable}
            set certificate-group <certificate-group_str>

        next
      end
    next
  end
```

Variable	Description	Default
"<server-pool_name>"	Enter the name of the server pool. The maximum length is	No default.

Variable	Description	Default
	63 characters. To display the list of existing servers, enter: `edit ?`	
`comment "<comment_str>"`	Enter a description or other comment. If the comment is more than one word or contains special characters, surround the comment with double quotes (`"`). The maximum length is 199 characters.	No default.
`health "<health-check_name>"`	Enter the name of a server health check FortiWeb uses to determine the responsiveness of server pool members. The maximum length is 63 characters. When you specify a health check for the pool, by default, all pool members use that health check. To select a different health check for a pool member, in the pool member configuration, specify `disable` for `health-check-inherit` and the health check to use for `health`. To display the list of existing health checks, enter: `edit ?` Available only if `type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}` (page 166) is `reverse-proxy` and `server-balance {enable | disable}` (page 166) is enable. **Note:** If a pool member is unresponsive, wait until the server becomes responsive again before disabling its server health check. Server health checks record the up or down status of the server. If you deactivate the server health check while the server is unresponsive, the server health check cannot update the recorded status, and FortiWeb continues to regard the physical server as if it were unresponsive. You can determine the physical server's connectivity status using the **Service Status** widget or an SNMP trap. For details, see "system snmp community" on page 301.	No default.
`http-reuse {aggressive | always | never | safe}`	Configure multiplexing so that FortiWeb uses a single connection to a server for requests from multiple clients. Enter one of these options: • `aggressive`—The first request from a client can use a cached server connection only when the cached server	`never`

Variable	Description	Default
	connection has been used by more than one client. • `always`—Client requests will use an available connection cached server connection. • `never`—Disable multiplexing. • `safe`—A client will establish a new connection for the first request, but will use an available cached server connection for subsequent requests. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	
`lb-algo {least-connections | round-robin | weighted-round-robin | uri-hash | full-uri-hash | host-hash | host-domain-hash | src-ip-hash}`	Select the load-balancing algorithms that FortiWeb uses when it distributes new connections among server pool members. • `least-connections`—Distributes new connections to the member with the fewest number of existing, fully-formed connections. • `round-robin`—Distributes new connections to the next member of the server pool, regardless of weight, response time, traffic load, or number of existing connections. Unresponsive servers are avoided. • `weighted-round-robin`—Distributes new connections using the round robin method, except that members with a higher weight value receive a larger percentage of connections. • `uri-hash`—Distributes new TCP connections using a hash algorithm based on the URI found in the HTTP header, excluding hostname. • `full-uri-hash`—Distributes new TCP connections using a hash algorithm based on the full URI string found in the HTTP header. The full URI string includes the hostname and path. • `host-hash`—Distributes new TCP connections using a hash algorithm based on the hostname in the HTTP Request header Host field. • `host-domain-hash`—Distributes new TCP connections using a hash algorithm based on the domain name in the HTTP Request header Host field. • `src-ip-hash`—Distributes new TCP connections using a hash algorithm based on the source IP address of the request. **Note**: When `protocol {HTTP | FTP | ADFSPIP}` (page 165) is set to `FTP`, only `round-robin`, `weighted-round-robin`, `least-connections`, and `src-ip-hash` are available.	`round-robin`

Variable	Description	Default
	For hash-based methods, if you specify a value for `persistence`, after an initial client request, FortiWeb routes any subsequent requests according to the persistence method. Otherwise, it routes subsequent requests according to the hash-based algorithm. Available only if `type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}` (page 166) is `reverse-proxy` and `server-balance {enable | disable}` (page 166) is enable.	
`persistence "<persistence-policy_name>"`	Enter the name of the persistence policy that specifies a session persistence method and timeout to apply to the pool. For details, see "server-policy persistence-policy" on page 132. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	No default.
`protocol {HTTP | FTP | ADFSPIP}`	Select one of the following: • `HTTP`—Specifies that the server pool governs HTTP traffic. Specific options for configuring an HTTP server pool become available. • `FTP`—Specifies that the server pool governs FTP traffic. Specific options for configuring an FTP server pool become available. • `ADFSPIP`—Specifies that the server pool governs HTTP traffic. Specific options for configuring an HTTP server pool become available.	`HTTP`
`reuse-conn-idle-time <int>`	Enter an idle time limit for a cached server connection. If a cached server connection remains idle for the set duration, it will be closed. The valid range is 1–1000.	`10`
`reuse-conn-max-count <int>`	Enter the maximum number of allowed cached server connections. If FortiWeb meets the set number, no more cached server connections will be established. The valid range is 1–1000 for each pserver. **Note**: The minimum number of cached connections depends on the number of CPU kernels of the FortiWeb platform. For example, a FortiWeb 4000E has 40 CPU kernels, so there are always at least 40 reusable connections for each pserver. In addition, the valid range	`100`

Variable	Description	Default
	is set for each pserver; if there are two pservers and you enter a value of 1000, there will be up to 2000 reusable connections.	
`reuse-conn-max-request <int>`	Enter the maximum number of HTTP responses that the cached server connection may handle. If a cached server connection meets the set number, it will be closed. The valid range is 1–1000.	`100`
`reuse-conn-total-time <int>`	Enter the maximum time limit in which a cached server connection may be reused. If a cached server connection exists for longer than the set limit, it will be closed. The valid range is 1–1000.	`100`
`server-balance {enable | disable}`	Specifies whether the pool contains a single server or multiple members. If the value is `enabled`, FortiWeb uses the specified load-balancing algorithm to distribute TCP connections among the members. If a member is unresponsive to the specified server health check, FortiWeb forwards subsequent connections to another member of the pool. Available only when `type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}` (page 166) is `reverse-proxy`.	`disable`
`server-pool-id`	A 64-bit random integer assigned to each server policy. The `policy-id` is a unique identification number for each server policy. When administrative domains (ADOMs) are enabled, ADOMs can create unique server policies with policy names that are identical to other server policies created by different ADOMs, so the `policy-id` can easily differentiate between different policies created by different ADOMs that may share the same policy name.	No default.
`type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}`	Select the current operation mode of the appliance to display the corresponding pool options. For details, see `opmode {offline-protection | reverse-proxy | transparent | transparent-inspection | wccp}` (page 300). **Note**: This option is applicable only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	`reverse-proxy`

Variable	Description	Default
`<entry_index>`	Enter the index number of the member entry within the server pool. The valid range is 1–9,223,372,036,854,775,807. For round robin-style load-balancing, the index number indicates the order in which FortiWeb distributes connections.	No default.
`backup-server {enable | disable}`	Enter `enable` to configure this pool member as a backup server. FortiWeb only routes connections for the pool to a backup server when all the other members of the server pool fail their server health check. The backup server mechanism does not work if you do not specify server health checks for the pool members. If you select this option for more than one pool member, FortiWeb uses the load balancing algorithm to determine which member to use.	`disable`
`certificate "<certificate_name>"`	Enter the name of the certificate that FortiWeb uses to decrypt SSL-secured connections. Available only if `ssl {enable | disable}` (page 176) is `enable`. The maximum length is 63 characters. To display the list of existing certificates, enter: `edit ?` **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	No default.
`certificate-verify "<verifier_name>"`	Enter the name of a certificate verifier, if any, to use when an HTTP client presents their personal certificate. If you do not specify one, the client is not required to present a personal certificate. However, if `ssl {enable | disable}` (page 176) is `enable` and the domain in the client request matches an entry in the specified SNI policy, FortiWeb uses the SNI configuration to determine which certificate verifier to use. Personal certificates, sometimes also called user certificates, establish the identity of the person connecting to the website. For details about how the client's certificate is verified, see `ssl-client-verify "<verifier_name>"` (page 152).	No default.

Variable	Description	Default
	You can require that clients present a certificate alternatively or in addition to HTTP authentication. For details, see `config waf http-authen http-authen-rule` (page 417). Available only if `ssl {enable | disable}` (page 176) is `transparent-servers-for-tp` and `ssl` is `enable`. For Reverse Proxy mode, configure this setting in the server policy instead. See `ssl-client-verify "<verifier_name>"` (page 152). The maximum length is 63 characters. To display the list of existing verifiers, enter: `edit ?` **Note:** The client must support TLS 1.0, TLS 1.1, or TLS 1.2. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	
`client-certificate "<client-certificate_name>"`	Enter the client certificate that FortiWeb uses to connect to this server pool member. Used when connections to this pool member require a valid client certificate. Available only if `type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}` (page 166) is `reverse-proxy` or `transparent-servers-for-tp` and `ssl {enable | disable}` (page 176) is `enable`. To upload a client certificate for FortiWeb, see the *FortiWeb Administration Guide*: http://docs.fortinet.com/fortiweb/admin-guides **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	`disable`
`client-certificate-forwarding {enable | disable}`	Enable to configure FortiWeb to include any X.509 personal certificates presented by clients during the SSL/TLS handshake with the traffic it forwards to the pool member. Available only if `type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp |`	`disable`

Variable	Description	Default
	`transparent-servers-for-wccp}` (page 166) is `transparent-servers-for-tp` and `ssl {enable | disable}` (page 176) is `enable`. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	
`client-certificate-forwarding-cert-header "<header_str>"`	Enter a custom certificate header that will include the Base64 certificate of the X.509 personal certificate presented by the client during the SSL/TLS handshake when it forwards the traffic to the protected web server. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	`x-client-cert`
`client-certificate-forwarding-sub-header "<header_str>"`	Enter a custom subject header that will include the subject of the X.509 personal certificate presented by the client during the SSL/TLS handshake when it forwards the traffic to the protected web server. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	`x-client-dn`
`client-certificate-proxy {enable | disable}`	Enable to configure seamless PKI integration. When this option is configured, FortiWeb attempts to verify client certificates when users make requests and resigns new certificates that it sends to the server. Also configure `client-certificate-proxy-sign-ca <sign_ca>` (page 169). **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	`disable`
`client-certificate-proxy-sign-ca <sign_ca>`	Select a Sign CA FortiWeb will use to verify and resign new client certificates. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	No default.
`conn-limit <conn-limit_int>`	Specifies the maximum number of TCP connections that FortiWeb forwards to this pool member. For no limit, specify `0` (the default value). The valid range is 0–1,048,576.	`0`
`domain "<server_fqdn>"`	Enter the fully-qualified domain name of the web server to include in the pool, such as `www.example.com`. **Warning:** Server policies do not apply features that do not	No default.

Variable	Description	Default
	yet support IPv6 to domain servers whose DNS names resolve to IPv6 addresses. **Tip:** For domain servers, FortiWeb queries a DNS server to query and resolve each web server's domain name to an IP address. For improved performance, do one of the following: • use physical servers instead • ensure highly reliable, low-latency service to a DNS server on your local network Available only if `server-type {physical | domain}` (page 174) is `domain`.	
`health-check-inherit {enable | disable}`	Select either: • `enable`—Use the health check specified by `health` in the server pool configuration. • `disable`—Use the health check specified by `health` in this pool member configuration.	`enable`
`hlck-domain <hlck-domain_str>`	Enter the domain name of the server pool.	No default.
`hpkp-header "<hpkp_name>"`	Enter an HPKP profile, if any, to use to verify certificates when clients attempt to access a server. HPKP prevents attackers from carrying out Man in the Middle (MITM) attacks with forged certificates. Available only when the operating mode is True Transparent Proxy. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	`disable`
`hsts-header {enable | disable}`	Enable to combat MITM attacks on HTTP by injecting the RFC 6797 (http://tools.ietf.org/html/rfc6797) strict transport security header into the reply, such as: `Strict-Transport-Security: max-age=31536000; includeSubDomains` This header forces the client to use HTTPS for subsequent visits to this domain. If the certificate does not validate, it also causes a fatal connection error: the client's web browser does not display a dialog that allows the user to override the certificate mismatch error and continue. Available only if `type {offline-protection |`	`disable`

Variable	Description	Default
	`reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}` (page 166) is `transparent-servers-for-tp` and `ssl {enable | disable}` (page 176) is `enable`. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	
`hsts-max-age <timeout_int>`	Enter the time to live in seconds for the HSTS header. This setting applies only if `hsts-header {enable | disable}` (page 170) is `enable`. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	`7776000`
`http2 {enable | disable}`	Enable to allow HTTP/2 communication between the FortiWeb and this back-end web server for HTTP/2 security inspections in Reverse Proxy mode; or enable HTTP/2 security inspections in True Transparent Proxy mode. When HTTP/2 security inspection is enabled in **Reverse Proxy mode** (see "server-policy policy" on page 136): 1. `enable`—Make sure the traffic is transferred in HTTP/2 between FortiWeb and this web server, if this web server supports HTTP/2. **Note:** Make sure that this back web server really supports HTTP/2 before you enable this, or connections will go failed. 2. `disable`—Make FortiWeb to converse HTTP/2 to HTTP/1.x for this web server, or converse HTTP/1.x to HTTP/2 for the clients, if this web server does not support HTTP/2. When FortiWeb operates in **True Transparent Proxy mode**(see `opmode {offline-protection | reverse-proxy | transparent | transparent-inspection | wccp}` (page 300)): 1. `enable`—Enable HTTP/2 security inspection. It only requires this option to be enabled and the SSL be well-configured to enable the HTTP/2 security inspection. No HTTP/2 configuration is required for `config server-policy policy` (page 136). When HTTP/2 inspection is enabled in True Transparent Proxy mode, FortiWeb performs no protocol conversions between HTTP/1.x and HTTP/2, which means HTTP/2 connections will not be	`disable`

Variable	Description	Default
	established between clients and back-end web servers if the web servers do not support HTTP/2. 2. `disable`—Disable HTTP/2 security inspection. **Note:** 1. This option is available only if `type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}` (page 166) is set to `reverse-proxy` or `transparent-servers-for-tp`; and when `type` is `transparent-servers-for-tp`, this option is available only if `ssl {enable | disable}` (page 176) is `enable`. 2. Please confirm your FortiWeb operation mode and the HTTP versions your back-end web servers are running first to make appropriate configuration here, so that HTTP/2 inspection can work correctly with your web servers. 3. For details about HTTP/2 support, see the FortiWeb Administration Guide: http://docs.fortinet.com/fortiweb/admin-guides **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	
`implicit_ssl {enable | disable}`	Enable so that FortiWeb will communicate with the pool member using implicit SSL. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is set to `FTP`.	`disable`
`intermediate-certificate-group "<CA-group_name>"`	Enter the name of a group of intermediate certificate authority (CA) certificates, if any, that FortiWeb presents to clients to complete the signing chain for them and validate the server certificate's CA signature. If clients receive certificate warnings that the server certificate configured in `certificate "<certificate_name>"` (page 167) has been signed by an intermediary CA, rather than directly by a root CA or other CA currently trusted by the client, configure this option. Alternatively, include the entire signing chain in the server certificate itself before uploading it to the FortiWeb appliance, thereby completing the chain of trust with a CA already known to the client. For details, see the FortiWeb Administration Guide:	No default.

Variable	Description	Default
	http://docs.fortinet.com/fortiweb/admin-guides Available only if `type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}` (page 166) is `transparent-servers-for-tp` and `ssl {enable | disable}` (page 176) is `enable`. For Reverse Proxy mode, configure this setting in the server policy instead. For details, see `intermediate-certificate-group "<CA-group_name>"` (page 146). **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	
`ip {"address_ipv4" | "address_ipv6"}`	Enter the IP address of the web server to include in the pool. **Warning:** Server policies do not apply to features that do not yet support IPv6 to servers specified using IPv6 addresses. Available only if `server-type {physical | domain}` (page 174) is `physical`.	No default.
`ocspstapling {enable | disable}`	Enable OCSP stapling for the certificate you specified in `certificate "<certificate_name>"` (page 167). This option is available only if SSL is enabled. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	`disable`
`ocspstapling-group "<group_name>"`	Enter the custom OCSP group that defines the CA certificate and URL of the OCSP server corresponding to the certificate specified in `certificate "<certificate_name>"` (page 167). For details, see "system certificate remote" on page 224. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	No default.
`port <port_int>`	Enter the TCP port number where the pool member listens for connections. The valid range is 1–65,535.	`80` (HTTP)/`21` (FTP)
`recover <recover_int>`	Specify the number of seconds that FortiWeb waits before it forwards traffic to this pool member after a health check indicates that this server is available again. The default is `0` (disabled).	`0`

Variable	Description	Default
	The valid range is 0–86,400. After the recovery period elapses, FortiWeb assigns connections at the rate specified by `warm-rate <warm-rate_int>` (page 181). Examples of when the server experiences a recovery and warm-up period: • A server is coming back online after the health check monitor detected it was down. • A network service is brought up before other daemons have finished initializing and therefore the server is using more CPU and memory resources than when startup is complete. To avoid connection problems, specify the separate warm-up rate, recovery rate, or both. **Tip:** During scheduled maintenance, you can also manually apply these limits by setting `status {disable |enable | maintain}` (page 179) to `maintain`.	
`server-side-sni {enable | disable}`	Specify whether FortiWeb supports Server Name Indication (SNI) for back-end servers that it applies this policy to. Enable this feature when the operating mode is transparent proxy, end-to-end encryption is required, and the back-end web server itself requires SNI support. When the operating mode is Reverse Proxy, you enable server-side SNI support using the server policy. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	`disable`
`server-type {physical | domain}`	Specify whether to specify the pool member by IP address or domain.	`physical`
`session-id-reuse {enable | disable}`	Enable so that FortiWeb reuses the session ID when establishing an SSL connection to a pserver. If the SSL connection has a server name, FortiWeb can only reuse a session ID for the specified pserver. If both a session ticket and ID exist for a pserver, FortiWeb will reuse the ticket. **Note**: This option is available only when `ssl {enable | disable}` (page 176) is enabled.	`disable`
`session-ticket-reuse`	Enable so that FortiWeb reuses the session ticket when	`disable`

Variable	Description	Default
`{enable | disable}`	establishing an SSL connection to a pserver. If the SSL connection has a server name, FortiWeb can only reuse a session ticket for the specified pserver. **Note**: This option is available only when `ssl {enable | disable}` (page 176) is enabled.	
`sni {enable | disable}`	Enable to use a Server Name Indication (SNI) configuration instead of or in addition to the server certificate specified by `certificate "<certificate_name>"` (page 167). The SNI configuration enables FortiWeb to determine which certificate to present on behalf of the members of a pool based on the domain in the client request. For details, see `config system certificate sni` (page 226). If you specify both a SNI configuration and a certificate, FortiWeb uses the certificate specified by `certificate "<certificate_name>"` (page 167) when the requested domain does not match a value in the SNI configuration. If you enable `sni-strict {enable | disable}` (page 176), FortiWeb always ignores the value of `certificate "<certificate_name>"` (page 167). Available only if `type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}` (page 166) is `transparent-servers-for-tp` and `ssl {enable | disable}` (page 176) is `enable`. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	`disable`
`sni-certificate "<sni_name>"`	Enter the name of the Server Name Indication (SNI) configuration that specifies which certificate FortiWeb uses when encrypting or decrypting SSL-secured connections for a specified domain. The SNI configuration enables FortiWeb to present different certificates on behalf of the members of a pool according to the requested domain. If only one certificate is required to encrypt and decrypt traffic that this policy applies to, specify `certificate "<certificate_name>"` (page 167) instead. Available only if `sni {enable | disable}` (page 175)	No default.

Variable	Description	Default
	is enabled. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	
`sni-strict {enable | disable}`	Select to configure FortiWeb to ignore the value of `certificate "<certificate_name>"` (page 167) when it determines which certificate to present on behalf of server pool members, even if the domain in a client request does not match a value in the specified SNI configuration. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	`disable`
`ssl {enable | disable}`	For Reverse Proxy, Offline Protection, and Transparent Inspection modes, specifies whether connections between FortiWeb and the pool member use SSL/TLS. For True Transparent Proxy and WCCP modes, specifies whether FortiWeb performs SSL/TLS processing for the pool members and connections between FortiWeb and the pool member use SSL/TLS. For Offline Protection and transparent modes, also configure `certificate "<certificate_name>"` (page 167). FortiWeb uses the certificate to decrypt and scan connections before passing the encrypted traffic through to the pool members (SSL inspection). For True Transparent Proxy, also configure `certificate "<certificate_name>"` (page 167) and additional SSL settings as required. FortiWeb handles SSL negotiations and encryption and decryption, instead of the pool member (SSL offloading). For Reverse Proxy mode, you can configure SSL offloading for all members of a pool using a server policy. For details, see "server-policy policy" on page 136. **Note:** When this option is enabled, the pool member must be configured to apply SSL. **Note:** Ephemeral (temporary key) Diffie-Hellman exchanges are not supported if the FortiWeb appliance is operating in Transparent Inspection or Offline Protection mode.	No default.
`ssl-cipher {medium | high | custom}`	For Reverse Proxy mode, specifies whether secure connections between FortiWeb and the server pool	`medium`

Variable	Description	Default
	member use a medium-security, high-security, or custom set of cipher suites. For True Transparent Proxy and WCCP modes, specifies whether secure connections between clients and FortiWeb and between FortiWeb and the server pool member use a medium-security, high-security, or custom set of cipher suites. If custom, also specify `ssl-custom-cipher {<cipher_1> <cipher2> <cipher3> ...}` (page 177). Do not set to `custom` if `http2 {enable | disable}` (page 171) is set to `enable`. For details, see the *FortiWeb Administration Guide*: http://docs.fortinet.com/fortiweb/admin-guides Available only if `type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}` (page 166) is `reverse-proxy`, `transparent-servers-for-tp`, or `transparent-servers-for-wccp`, and `ssl {enable | disable}` (page 176) is `enable`.	

`ssl-custom-cipher {<cipher_1> <cipher2> <cipher3> ...}`	Specify one or more cipher suites that FortiWeb allows.
	
	Separate the name of each cipher with a space. To remove from or add to the list of ciphers, retype the entire list.
	
	Valid values are:
	
	`ECDHE-ECDSA-AES256-GCM-SHA384`
	`ECDHE-RSA-AES256-GCM-SHA384`
	`DHE-DSS-AES256-GCM-SHA384`
	`DHE-RSA-AES256-GCM-SHA384`
	`ECDHE-ECDSA-CHACHA20-POLY1305`
	`ECDHE-RSA-CHACHA20-POLY1305`
	`DHE-RSA-CHACHA20-POLY1305`

		`ECDHE-RSA-`

Variable	Description	Default
	DHE-RSA-AES128-CCM8 DHE-RSA-AES128-CCM ECDHE-ECDSA-AES256-SHA384 ECDHE-RSA-AES256-SHA384 DHE-RSA-AES256-SHA256 DHE-DSS-AES256-SHA256 ECDHE-ECDSA-CAMELLIA256-SHA384 ECDHE-RSA-CAMELLIA256-SHA384 DHE-RSA-CAMELLIA256-SHA256 DHE-DSS-CAMELLIA256-SHA256 ECDHE-ECDSA-AES128-SHA256 ECDHE-RSA-AES128-SHA256 DHE-RSA-AES128-SHA256 DHE-DSS-AES128-SHA256 ECDHE-ECDSA-CAMELLIA128-SHA256 ECDHE-RSA-CAMELLIA128-SHA256 DHE-RSA-CAMELLIA128-SHA256 DHE-DSS-CAMELLIA128-SHA256 ECDHE-ECDSA-AES256-SHA ECDHE-RSA-AES256-SHA DHE-RSA-AES256-SHA DHE-DSS-AES256-SHA DHE-RSA-CAMELLIA256-SHA DHE-DSS-CAMELLIA256-SHA ECDHE-ECDSA-AES128-SHA ECDHE-RSA-AES128-SHA DHE-RSA-AES128-SHA DHE-DSS-AES128-SHA DHE-RSA-CAMELLIA128-SHA DHE-DSS-CAMELLIA128-SHA AES256-GCM-SHA384 AES256-CCM8 AES256-CCM AES128-GCM-SHA256 AES128-CCM8 AES128-CCM AES256-SHA256 CAMELLIA256-SHA256 AES128-SHA256 CAMELLIA128-SHA256 AES256-SHA CAMELLIA256-SHA AES128-SHA CAMELLIA128-SHA DHE-RSA-SEED-SHA ECDHE_RSA_DES_CBC3_SHA DES_CBC3_SHA	AES256-SHA384 ECDHE-ECDSA-AES128-SHA256 ECDHE-RSA-AES128-SHA256 ECDHE-ECDSA-AES256-SHA ECDHE-RSA-AES256-SHA ECDHE-ECDSA-AES128-SHA ECDHE-RSA-AES128-SHA AES256-GCM-SHA384 AES128-GCM-SHA256 AES256-SHA256 AES128-SHA256
ssl-noreg {enable | disable}	Select to configure FortiWeb to ignore requests from clients to renegotiate TLS or SSL. Protects against denial-of-service (DoS) attacks that use TLS/SSL renegotiation to overburden the server.	enable

Variable	Description	Default
	Available only if `type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}` (page 166) is `transparent-servers-for-tp` and `ssl {enable | disable}` (page 176) is `enable`. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	
`status {disable |enable | maintain}`	To specify the status of the pool member, enter one of the following values: • `enable`—Specifies that this pool member can receive new sessions from FortiWeb. • `disable`—Specifies that this pool member does not receive new sessions from FortiWeb and FortiWeb closes any current sessions as soon as possible. • `maintain`—Specifies that this pool member does not receive new sessions from FortiWeb but FortiWeb maintains any current connections.	`enable`
`tls-v10 {enable | disable}`	For Reverse Proxy mode, specifies whether secure connections between FortiWeb and the server pool member can use the TLS 1.0 cryptographic protocol. For True Transparent Proxy and WCCP modes, specifies whether secure connections between clients and FortiWeb and between FortiWeb and the server pool member can use the TLS 1.0 cryptographic protocol. This must be set to `disable` if `http2 {enable | disable}` (page 171) is set to `enable`. Available only if `type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}` (page 166) is `reverse-proxy`, `transparent-servers-for-tp`, or `transparent-servers-for-wccp`, and `ssl {enable | disable}` (page 176) is `enable`.	`enable`
`tls-v11 {enable | disable}`	For Reverse Proxy mode, specifies whether secure connections between FortiWeb and the server pool member can use the TLS 1.1 cryptographic protocol. For True Transparent Proxy and WCCP modes, specifies whether secure connections between clients and FortiWeb and between FortiWeb and the server pool	`enable`

Variable	Description	Default
	member can use the TLS 1.1 cryptographic protocol. This must be set to `disable` if `http2 {enable | disable}` (page 171) is set to `enable`. Available only if `type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}` (page 166) is `reverse-proxy`, `transparent-servers-for-tp`, or `transparent-servers-for-wccp`, and `ssl {enable | disable}` (page 176) is `enable`.	
`tls-v12 {enable | disable}`	For Reverse Proxy mode, specifies whether secure connections between FortiWeb and the server pool member can use the TLS 1.2 cryptographic protocol. For True Transparent Proxy and WCCP modes, specifies whether secure connections between clients and FortiWeb and between FortiWeb and the server pool member can use the TLS 1.2 cryptographic protocol. Available only if `type {offline-protection | reverse-proxy | transparent-servers-for-ti | transparent-servers-for-tp | transparent-servers-for-wccp}` (page 166) is `reverse-proxy`, `transparent-servers-for-tp`, or `transparent-servers-for-wccp`, and `ssl {enable | disable}` (page 176) is `enable`.	`enable`
`url-cert {enable | disable}`	Specifies whether FortiWeb uses a URL-based client certificate group to determine whether a client is required to present a personal certificate. Available only if `https-service "<service_name>"` (page 146) is configured. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	`disable`
`urlcert-group "<urlcert-group_name>"`	Enter the URL-based client certificate group that determines whether a client is required to present a personal certificate. If the URL the client requests does not match an entry in the group, the client is not required to present a personal certificate. For details about creating a group, see "system certificate urlcert" on page 228.	No default.

Variable	Description	Default
	Note: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	
`urlcert-hlen <len_int>`	Enter the maximum allowed length for an HTTP request with a URL that matches an entry in the URL-based client certificate group, in kilobytes. FortiWeb blocks any matching requests that exceed the specified size. This setting prevents a request from exceeding the maximum buffer size. The valid range is 16–128. **Note**: This option is available only when the `protocol {HTTP | FTP | ADFSPIP}` (page 165) is `HTTP`.	No default.
`warm-rate <warm-rate_int>`	Specify the maximum connection rate (per second) while the pool member is starting up. The default is 10 connections per second. The valid range is 1–86,400. The warm up calibration is useful with servers that bring up the network service before other daemons are initialized. As these types of servers come online, CPU and memory are more utilized than they are during normal operation. For these servers, you define separate rates based on warm-up and recovery behavior. For example, if `warm-up <warm-up_int>` (page 181) is `5` and `warm-rate` is `2`, the maximum number of new connections increases at the following rate: • 1st second—Total of 2 new connections allowed (0+2). • 2nd second—2 new connections added for a total of 4 new connections allowed (2+2). • 3rd second—2 new connections added for a total of 6 new connections allowed (4+2). • 4th second—2 new connections added for a total of 8 new connections allowed (6+2). • 5th second—2 new connections added for a total of 10 new connections allowed (8+2).	`10`
`warm-up <warm-up_int>`	Specify for how long (in seconds) FortiWeb forwards traffic at a reduced rate after a health check indicates that this pool member is available again but it cannot yet handle a full connection load.	`0`

Variable	Description	Default
	For example, when the pool member begins to respond but startup is not fully complete. The default is `0` (disabled). The valid range is 0–86,400.	
`weight <weight_int>`	If the server pool uses the weighted round robin load-balancing algorithm, type the numerical weight of the pool member. Members with a greater weight receive a greater proportion of connections. The valid range is 1–9,999.	`0`
`ssl-session-timeout <ssl-session-timeout_int>`	When FortiWeb is configured as an SSL server, you can set SSL session timeout intervals via the CLI. This is available only in Reverse Proxy and True Transparent Proxy modes.	No default.
`ssl-quiet-shutdown {enable | disable}`	For HTTPS connection, when disabled, FortiWeb sends ssl alert message to the client or server pool first, and then FIN. When enabled, FortiWeb directly sends FIN message instead of sending ssl alert message.	`Disable`
`server-certificate-verify {enable | disable}`	Enable so that FortiWeb appliance will verify certificates presented by HTTP server.	`Disable`
`server-certificate-verify-policy "<policy_name>"`	Enter the certificate verity policy name.	No default.
`server-certificate-verify-action {alert | alert_deny | redirect}`	Select which action the FortiWeb appliance will take when it detects a certificate violation.	No default.
`adfs-domain <adfs-domain_str>`	Even if you have selected IP for `server-type {physical | domain}`, the AD FS server's domain name is still required, because the AD FS server will validate the domain name when FortiWeb sets up HTTPS connections with it.	No default.
`adfs-username <adfs-username_str>`	Type the username that will be used by FortiWeb to connect with the AD FS server. You should include the domain to which FortiWeb and the AD FS server belong. For example, damain1\administrator.	No default.
`adfs-password <adfs-password_str>`	Type the password that will be used by FortiWeb to connect with the AD FS server.	No default.
`multi-certificate`	Enable this option to allow FortiWeb to use multiple local	`disable`

Variable	Description	Default
`{enable | disable}`	certificates. Available when: `ssl {enable | disable}` is enabled, and FortiWeb is operating in TTP or WCCP that performs SSL inspection.	
`certificate-group <certificate-group_str>`	Select a created multi-certificate file.	No default.

Example

This example configures a server pool named `server-pool1`. It consists of two physical servers: `192.0.2.10` and `192.0.2.11`.

When both servers are available, FortiWeb forwards connections to the server with the smallest number of connections.

```
config server-policy server-pool
   edit "server-pool1"
      set type reverse-proxy
      set server-balance enable
      set lb-algo least-connections
      config pserver-list
         edit 1
            set status enable
            set server-type physical
            set ip "192.0.2.10"
            set ssl disable
            set port 8081
         next
         edit 2
            set status enable
            set server-type physical
            set ip "192.0.2.11"
            set ssl disable
            set port 8082
         next
      end
   next
end
```

server-policy service custom

Use this command to configure a custom service.

You can add a custom services to a policy to define the protocol and listening port of a virtual server. For details, see "server-policy policy" on page 136.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `traroutegrp` area. For details, see "Permissions" on page 55.

Syntax

```
config server-policy service custom
  edit "<service_name>"
    set port <port_int>
    set protocol TCP
  next
end
```

Variable	Description	Default
`"<service_name>"`	Enter the name of the new or existing custom network service. The maximum length is 63 characters. To display the list of existing services, enter: `edit ?`	No default.
`port <port_int>`	Enter the port number on which a virtual server will receive TCP/IP connections for HTTP or HTTPS requests. The valid range is 1–65,535.	No default.

Example

This example configures a service definition named `SOAP1`.

```
config server-policy service custom
  edit "SOAP1"
    set port 8081
    set protocol TCP
  next
end
```

server-policy service predefined

Use this command to view a predefined service.

This command only displays predefined services. It **cannot** be used to modify them. If you attempt to edit the port number and protocol, the appliance will discard your settings.

Predefined Internet services can be selected in a policy in order to define the protocol and listening port of a virtual server. For details, see "server-policy policy" on page 136.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `traroutegrp` area. For details, see "Permissions" on page 55.

Syntax

```
config server-policy service predefined
  edit "<service_name>"
    show
  next
end
```

Variable	Description	Default
"<service_name>"	Enter the name of a predefined network service, such as `HTTP` or `HTTPS`. The maximum length is 63 characters. To display the list of existing services, enter: `edit ?`	No default.

Example

This example shows the default settings for all of the predefined services.

```
config server-policy service predefined
  show
```

Output:

```
config server-policy service predefined
  edit HTTP
    set port 80
    set protocol TCP
  next
  edit HTTPS
    set port 443
    set protocol TCP
  next
end
```

server-policy setting

Use this command to configure the server policy settings.

Syntax

```
config server-policy setting
   set core-file-count <core-file-count_int>
   set enable-core-file {enable | disable}
   set enable-session-statistics {enable | disable}
   set enable-single-worker {enable | disable}
   set hsm {enable | disable}
   set no-session-limit {enable | disable}
   set no-ssl-encrypt-then-mac {enable | disable}
   set offline-session-timeout {seconds_int}
   set use-first-ack-mac {enable | disable}
   set dpdk {enable | disable}
   set high-compatibility-mode {enable | disable}
   set graceful-shutdown {enable | disable}
   set server-pool-connection-limit-log {enable | disable}
end
```

Variable	Description	Default
`core-file-count <core-file-count_int>`	The maximum core dump file number. The valid values are 3 and 5.	No default
`enable-core-file {enable | disable}`	Enable/disable generating the core dump files.	No default
`enable-session-statistics {enable | disable}`	Enable/disable session statistics for FortiView.	No default
`enable-single-worker {enable | disable}`	Enable/disable single worker mode.	No default
`hsm {enable | disable}`	Specifies whether the settings you use to integrate FortiWeb with an HSM (hardware security module) are displayed in the web UI.	No default
`no-session-limit {enable | disable}`	Enable not to limit the maximum concurrency sessions of virtual machine.	No default

Variable	Description	Default
`no-ssl-encrypt-then-mac {enable | disable}`	Disable to include the encrypt-then-mac extension in the packets sent by the client.	`disable`
`use-first-ack-mac {enable | disable}`	Once enabled, machine learning only observes the source MAC of two ACK packets for a URL at Three-way handshake. If disabled, machine leaning observes all ACK packets, which continues refreshing MAC, with the performance affected.	`enable`
`dpdk {enable | disable}`	Enable/disable DPDK for packet processing.	No default
`high-compatibility-mode {enable | disable}`	Enable to accelerate SSL transport.	`disable`
`offline-session-timeout {seconds_int}`	Enter the offline session timeout. The valid range is seconds 30–1200 seconds.	No default
`graceful-shutdown {enable | disable}`	If disabled, the peer TCP connections are reset during system shutdown.	`enable`
`server-pool-connection-limit-log {enable | disable}`	Enable to send a warning level event log when the connection number of each real server reaches the limitation.	`disable`

server policy traffic-mirror

Use this command to configure FortiWeb to send traffic to third party IPS/IDS devices through network interfaces for traffic monitoring in Reverse Proxy and True Transparent Proxy modes.

See "system feature-visibility" on page 1 for how to enable traffic mirror first.

Syntax

```
config server-policy traffic-mirror
   edit "<traffic-mirror_name>"
   config mirror-rule
      edit mirror-rule <mirror-rule_str>
         set mode {direct | switch | server}
         set interface <interface_int>
         set destination-mac <destination-mac_str>
         set server-ip <server-ip_str>
         set server-port <server-port_int>
         next
      end
   next
```

```
end
```

Variable	Description	Default
"<traffic-mirror_name>"	Enter a name for the traffic mirror policy.	No default.
mirror-rule <mirror-rule_str>	Select the sequence number of the mirror rule created.	No default.
mode {direct | switch | server}	Select one of the three modes: • Direct—the mirrored packets are directly sent to IPS/IDS devices. • Switch—the mirrored packets are sent to IPS/IDS devices through the switch. • Server—the mirrored packets are sent to the designated IP of IPS/IDS devices.	direct
interface <interface_int>	When the mode is Direct, select one FortiWeb port to connect to IPS/IDS device. When the mode is Switch, select one FortiWeb port to connect to the switch.	No default.
destination-mac <destination-mac_str>	Type the MAC of IPS/IDS interface, where the traffic from FortiWeb goes to. Available only when mode {direct | switch | server} (page 188) is Switch.	No default.
server-ip <server-ip_str>	Enter the designated IP of IPS/IDS devices. Available only when mode {direct | switch | server} (page 188) is Server.	No default.
server-port <server-port_int>	Enter the HTTP port that the IPS/IDS devices can listen to. Available only when mode {direct | switch | server} (page 188) is Server.	No default.

Example

This example configures a traffic mirror policy.

```
config server-policy traffic-mirror
   edit policy1
   config mirror-rule
      edit 2
         set mode direct
         set interface port1

         end
   next
end
```

server-policy vserver

Use this command to configure virtual servers.

Before you can create a policy, you must first configure a virtual server which defines the network interface or bridge and IP address on which traffic destined for an individual physical server or server farm will arrive.

When the FortiWeb appliance receives traffic destined for a virtual server, it can then forward the traffic to a physical server or a server farm. The FortiWeb appliance identifies traffic as being destined for a specific virtual server if:

- The traffic arrives on the network interface or bridge associated with the virtual server
- For Reverse Proxy mode, the destination address is the IP address of a virtual server (the destination IP address is ignored in other operation modes, **except** that it must **not** be identical with the physical server's IP address)

Virtual servers can be on the same subnet as physical servers. This configuration creates a one-arm HTTP proxy. For example, the virtual server 192.0.2.1/24 could forward to the physical server 192.0.2.2.

However, this is **not** recommended. Unless your network's routing configuration prevents it, it could allow attackers that are aware of the physical server's IP address to bypass FortiWeb by accessing the physical server directly.

To apply virtual servers, select them within a server policy. For details, see "server-policy policy" on page 136.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `traroutegrp` area. For details, see "Permissions" on page 55.

Syntax

```
config server-policy vserver
   edit "<virtual-server_name>"
      set status {enable | disable}
      set interface "<interface_name>"
      set vip "<virtual-ip_ipv4mask>"
      set vip6 "<virtual-ip_ipv6mask>"
      set use-interface-ip {enable | disable}
   next
end
```

Variable	Description	Default
`"<virtual-server_name>"`	Enter the name of the new or existing virtual server. The maximum length is 63 characters. To display the list of existing servers, enter: `edit ?`	`disable`
`status {enable | disable}`	Enable to accept traffic destined for this virtual server.	No default.

Variable	Description	Default
`interface "<interface_name>"`	Enter the name of the network interface or bridge, such as `port1` or `bridge1`, to which the virtual server is bound, and on which traffic destined for the virtual server will arrive. The maximum length is 63 characters. To display the list of existing interfaces, enter: `edit ?`	No default.
`vip "<virtual-ip_ipv4mask>"`	Enter the IPv4 address and subnet of the virtual server.	`0.0.0.0 0.0.0.0`
`vip6 "<virtual-ip_ipv6mask>"`	Enter the IPv6 address and subnet of the virtual server.	`::/0`
`use-interface-ip {enable | disable}`	For FortiWeb-VM on Microsoft Azure, specify whether the virtual server uses the IP address of the specified interface, instead of an IP specified by `vip` or `vip6`.	`disable`

Example

This example configures a virtual server named `inline_vip1` on the network interface named `port1`.

The port number on which the virtual server will receive traffic is defined separately, in the policies that use this virtual server definition.

```
config server-policy vserver
   edit "inline_vip1"
      set status enable
      set interface port1
      set vip "192.0.2.1 255.255.255.0"
   next
end
```

system accprofile

Use this command to configure access control profiles for administrators.

If you have configured RADIUS queries for authenticating administrators, you can override the locally-selected access profile by using a RADIUS VSA. For details, see "system admin" on page 193.

Access profiles determine administrator accounts' permissions.

When an administrator has only read access to a feature, the administrator can access the web UI page for that feature, and can use the `get` and `show` CLI command for that feature, but cannot make changes to the configuration. There are no **Create** or **Apply** buttons, or `config` CLI commands. Lists display only the **View** icon instead of icons for **Edit**, **Delete** or other modification commands. Write access is required for modification of any kind.

In larger companies where multiple administrators divide the share of work, access profiles often reflect the specific job that each administrator does ("role"), such as user account creation or log auditing. Access profiles can limit each administrator account to their assigned role. This is sometimes called role-based access control (RBAC).

The `prof_admin` access profile, a special access profile assigned to the `admin` administrator account and required by it, **does not** appear in the list of access profiles. It exists by default and cannot be changed or deleted, and consists of essentially UNIX `root`-like permissions.

If you create more administrator accounts, whether to harden security or simply to prevent accidental modification, create other access profiles with the minimal degrees and areas of access that each role requires. Then assign each administrator account the appropriate role-based access profile.

For example, for a person whose only role is to audit the log messages, you might make an access profile named `auditor` that only has **Read** permissions to the **Log & Report** area.

For information on how each access control area correlates to which CLI commands that administrators can access, see "Permissions" on page 55

To use this command, your administrator account's access control profile must have both `r` and `w` permissions to items in the `admingrp` category.

Syntax

```
config system accprofile
   edit "<access-profile_name>"
      set admingrp {none | r | rw | w}
      set authusergrp {none | r | rw | w}
      set loggrp {none | r | rw | w}
      set mlgrp {none | r | rw | w}
      set mntgrp {none | r | rw | w}
      set netgrp {none | r | rw | w}
      set sysgrp {none | r | rw | w}
      set traroutegrp {none | r | rw | w}
      set syncookie {enable | disable}
      set webgrp {none | r | rw | w}
      set wvsgrp {none | r | rw | w}
   next
end
```

Variable	Description	Default
"<access-profile_name>"	Enter the name of the access profile. The maximum length is 63 characters.	No default.

Variable	Description	Default
	To display the list of existing profiles, enter: `edit ?`	
`admingrp {none | r | rw | w}`	Enter the degree of access that administrator accounts using this access profile will have to the system administrator configuration. Available only when administrative domains (ADOMs) are disabled. For details, see .	`none`
`authusergrp {none | r | rw | w}`	Enter the degree of access that administrator accounts using this access profile will have to the HTTP authentication user configuration.	`none`
`loggrp {none | r | rw | w}`	Enter the degree of access that administrator accounts using this access profile will have to the logging and alert email configuration.	`none`
`mlgrp {none | r | rw | w}`	Enter the degree of access that administrator accounts using this access profile will have to the machine learning configuration.	`none`
`mntgrp {none | r | rw | w}`	Enter the degree of access that administrator accounts using this access profile will have to maintenance commands. Unlike the other rows, whose scope is an area of the configuration, the maintenance access control area does not affect the configuration. Instead, it indicates whether the administrator can perform special system operations such as changing the firmware.	`none`
`netgrp {none | r | rw | w}`	Enter the degree of access that administrator accounts using this access profile will have to the network interface and routing configuration.	`none`
`sysgrp {none | r | rw | w}`	Enter the degree of access that administrator accounts using this access profile will have to the basic system configuration (except for areas included in other access control areas such as `admingrp`).	`none`
`traroutegrp {none | r | rw | w}`	Enter the degree of access that administrator accounts using this access profile will have to the server policy (formerly called traffic routing) configuration.	`none`
`wadgrp {none | r | rw | w}`	Enter the degree of access that administrator accounts using this access profile will have to the web anti-defacement configuration.	`none`
`webgrp {none | r | rw | w}`	Enter the degree of access that administrator accounts using this access profile will have to the web protection profile configuration.	`none`
`wvsgrp {none | r | rw | w}`	Enter the degree of access that administrator accounts using this access profile will have to the web vulnerability scanner.	`none`

Example

This example configures an administrator access profile named `full_access`, which permits both read and write access to all special operations and parts of the configuration.

Even though this access profile configures full access, administrator accounts using this access profile will **not** be fully equivalent to the `admin` administrator. The `admin` administrator has some special privileges that are inherent in that account and cannot be granted through an access profile, such as the ability to reset other administrators' passwords without knowing their current password. Other accounts should therefore not be considered a substitute, even if they are granted full access.

```
config system accprofile
   edit "full_access"
      set admingrp rw
      set authusergrp rw
      set loggrp rw
      set mlgrp rw
      set mntgrp rw
      set netgrp rw
      set sysgrp rw
      set traroutegrp rw
      set wadgrp rw
      set webgrp rw
      set wvsgrp rw
   next
end
```

system admin

Use this command to configure FortiWeb administrator accounts. In its factory default configuration, a FortiWeb appliance has one administrator account, named `admin`. That administrator has permissions that grant full access to the FortiWeb configuration and firmware. After connecting to the web UI or the CLI using the `admin` administrator account, you can configure additional administrator accounts with various levels of access to different parts of the FortiWeb configuration.

Administrators can access the web UI and the CLI through the network, depending on administrator account's trusted hosts, ADOMs, and the administrative access protocols enabled for each of the FortiWeb appliance's network interfaces. For details, see "system interface" on page 281, , and "Connecting to the CLI" on page 43.

To prevent multiple administrators from logging in simultaneously, which could allow them to inadvertently overwrite each other's changes, enable . For details, see .

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system admin
   edit "<administrator_name>"
      set accprofile "<access-profile_name>"
      set accprofile-override {enable | disable}
      set domains "<adom_name>"
      set password "<password_str>"
      set email-address "<contact_email>"
      set first-name "<name_str>"
      set last-name "<surname_str>"
      set mobile-number "<cell-phone_str>"
      set phone-number "<phone_str>"
      set trusthost1 "<management-computer_ipv4mask>"
      set trusthost2 "<management-computer_ipv4mask>"
      set trusthost3 "<management-computer_ipv4mask>"
      set ip6trusthost1 "<management-computer_ipv6mask>"
      set ip6trusthost2 "<management-computer_ipv6mask>"
      set ip6trusthost3 "<management-computer_ipv6mask>"
      set type {local-user | remote-user}
      set admin-usergroup "<remote-auth-group_name>"
      set wildcard {enable | disable}
      set sshkey "<sshkey_str>"
      set force-password-change {enable | disable}

   next
end
```

Variable	Description	Default
`"<administrator_name>"`	Enter the name of the administrator account, such as `admin1` or `admin@example.com`, that can be referenced in other parts of the configuration. Do not use spaces or special characters except the 'at' symbol (`@`). The maximum length is 63 characters. To display the list of existing accounts, enter: `edit ?` **Note:** This is the user name that the administrator must provide when logging in to the CLI or web UI. If using an external authentication server such as RADIUS or Active Directory, this name will be passed to the server via the remote authentication query.	No default.
`accprofile "<access-profile_name>"`	Enter the name of an access profile that gives the permissions for this administrator account. See also "system accprofile" on page 190. The maximum length is 63 characters.	No default.

Variable	Description	Default

	You can select **prof_admin**, a special access profile used by the `admin` administrator account. However, selecting this access profile will **not** confer all of the same permissions of the `admin` administrator. For example, the new administrator would not be able to reset lost administrator passwords.
	To display the list of existing profiles, enter:
	`edit ?`
	Tip: Alternatively, if your administrator accounts authenticate via a RADIUS query, you can assign their access profile through the RADIUS server using RFC 2548 (http://www.ietf.org/rfc/rfc2548.txt) Microsoft Vendor-specific RADIUS Attributes.
	On the RADIUS server, create an attribute named:
	`ATTRIBUTE` FortiWeb`-Access-Profile 7`
	then set its value to be the name of the access profile that you want to assign to this account. Finally, in the CLI, use `accprofile-override {enable | disable}` (page 195) to enable the override.
	If none is assigned on the RADIUS server, or if it does not match the name of an existing access profile on FortiWeb, FortiWeb will fail back to use the one locally assigned by this setting.	

`accprofile-override {enable | disable}`	Enable to use the access profile indicated by the RADIUS query response, and ignore `accprofile "<access-profile_name>"` (page 194). This setting applies only if `admin-usergroup "<remote-auth-group_name>"` (page 197) is configured to use a RADIUS query to authenticate this account. This setting applies only if ADOMs are enabled. See .	`disable`
`domains "<adom_name>"`	Enter the name of an administrative domain (ADOM) to assign and restrict this administrative account to it. This setting applies only if ADOMs are enabled. See .	No default.
`password "<password_str>"`	Enter a password for the administrator account. The maximum length is 32 characters. The minimum length is 1 character. For improved security, the password should be at least 8	No default.

Variable	Description	Default
	characters long, be sufficiently complex, and be changed regularly. This setting applies only when `type` is `local-user`. For accounts defined on a remote authentication server, the FortiWeb appliance will instead query the server to verify whether the password given during a login attempt matches the account's definition.	
`email-address "<contact_email>"`	Enter an email address that can be used to contact this administrator. The maximum length is 63 characters.	No default.
`first-name "<name_str>"`	Enter the first name of the administrator. The maximum length is 63 characters.	No default.
`last-name "<surname_str>"`	Enter the surname of the administrator. The maximum length is 63 characters.	No default.
`mobile-number "<cell-phone_str>"`	Enter a cell phone number that can be used to contact this administrator. The maximum length is 63 characters.	No default.
`phone-number "<phone_str>"`	Enter a phone number that can be used to contact this administrator. The maximum length is 63 characters.	No default.
`trusthost1 "<management-computer_ipv4mask>"`	Enter the IP address and netmask of a management computer or management LAN from which the administrator is allowed to log in to the FortiWeb appliance. You can specify up to three trusted hosts. To allow login attempts from any IP address, enter `0.0.0.0/0.0.0.0`. If you allow administrators to log in from any IP address, consider choosing a longer and more complex password, and limiting administrative access to secure protocols to minimize the security risk. For details about administrative access protocols, see "system interface" on page 281. **Note:** For improved security, restrict all three trusted host addresses to the IP addresses of computers from which only this administrator will log in.	`0.0.0.0 0.0.0.0`
`trusthost2 "<management-computer_ipv4mask>"`	Enter a second IP address and netmask of a management computer or management LAN from which the administrator is allowed to log in to the FortiWeb appliance. To allow login attempts from any IP address, enter `0.0.0.0/0.0.0.0`.	`0.0.0.0 0.0.0.0`
`trusthost3 "<management-computer_ipv4mask>"`	Enter a third IP address and netmask of a management	`0.0.0.0`

Variable	Description	Default
	computer or management LAN from which the administrator is allowed to log in to the FortiWeb appliance. To allow login attempts from any IP address, enter `0.0.0.0/0.0.0.0`.	`0.0.0.0`
`ip6trusthost1 "<management-computer_ipv6mask>"`	Enter the IP address and netmask of a management computer or management LAN from which the administrator is allowed to log in to the FortiWeb appliance. You can specify up to three trusted hosts. To allow login attempts from any IP address, enter `::/0`. **Caution:** If you allow logins from any IP address, consider choosing a longer and more complex password, and limiting administrative access to secure protocols to minimize the security risk. Unlike IPv4, IPv6 does **not** isolate public from private networks via NAT, and therefore can increase availability of your FortiWeb's web UI/CLI to IPv6 attackers unless you have carefully configured your firewall/FortiGate and routers. For details about administrative access protocols, see "system interface" on page 281. **Note:** For improved security, restrict all three trusted host addresses to the IP addresses of computers from which only this administrator will log in.	`::/0`
`ip6trusthost2 "<management-computer_ipv6mask>"`	Enter a second IP address and netmask of a management computer or management LAN from which the administrator is allowed to log in to the FortiWeb appliance. To allow login attempts from any IP address, enter `::/0`.	`::/0`
`ip6trusthost3 "<management-computer_ipv6mask>"`	Enter a third IP address and netmask of a management computer or management LAN from which the administrator is allowed to log in to the FortiWeb appliance. To allow login attempts from any IP address, enter `::/0`.	`::/0`
`type {local-user | remote-user}`	Select either: • `local-user`—Authenticate this account locally, with the FortiWeb appliance itself. • `remote-user`—Authenticate this account via a remote server such as an LDAP or RADIUS server. Also configure `admin-usergroup "<remote-auth-group_name>"` (page 197).	No default.
`admin-usergroup "<remote-auth-group_name>"`	Enter the name of the remote authentication group whose settings the FortiWeb appliance will use to connect to a remote authentication server when authenticating login	No default.

Variable	Description	Default
	attempts for this account. The maximum length is 63 characters. To display the list of existing groups, enter: `edit ?` For details about configuring remote authentication groups, see "user admin-usergrp" on page 318.	
`wildcard {enable | disable}`	Used when administrator accounts authenticate via a RADIUS query. This setting applies only if the value of `type {local-user | remote-user}` (page 197) is `remote-user`.	No default.
`sshkey "<sshkey_str>"`	The public key used for connecting to the CLI using a public-private key pair. For more information on connecting to the CLI using a public-private key pair, see “Connecting to the CLI” in the *FortiWeb Administration Guide*: http://docs.fortinet.com/fortiweb/admin-guides	No default.
`force-password-change {enable | disable}`	Enable/disable force password change for next login. This field can be configured only when **Password Policy** is enabled in **System > Admin > Settings**.	Disable

Example

This example configures an administrator account with an access profile that grants only permission to read logs. This account can log in only from an IP address on the management LAN (`192.0.2.1/24`), or from one of two specific IP addresses (`192.0.2.15` and `192.0.2.50`).

```
config system admin
  edit "log-auditor"
    set accprofile "log_read_access"
    set password "P@ssw0rd"
    set email-address "log-admin@example.com"
    set trusthost1 "192.0.2.1 255.255.255.0"
    set trusthost2 "192.0.2.15 255.255.255.255"
    set trusthost3 "192.0.2.50 255.255.255.255"
    set force-password-change enable
end
```

To display all dashboard status and widget settings, enter:

```
config system admin
  show
```

system admin-certificate ca

When FortiWeb's certificate-based Web UI login is applied. Besides the administrators' certificates information, the corresponding certificate authority (CA) certificates are required to be stored on the FortiWeb appliance. Certificate authorities validate and sign other certificates in order to indicate to third parties that those other certificates are authentic and can be trusted. FortiWeb authorizes the administrator's login by verifying its certificate with the corresponding CA.

Use this command to show the names of the CA certificates that are relative to the administrators' certificates. You use the web UI to upload these certificates.

CA certificates are not used directly here (no set operations are defined), but they are required when you create a PKI user (an administrator that FortiWeb authorizes base on his certificate) on the FortiWeb. For details, see "user pki-user" on page 326.

For information about certificate-based Web UI login, see the *FortiWeb Administration Guide*:

http://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
show system admin-certificate ca
```

Example

```
config system admin-certificate ca
   edit "CA_Cert_1"
   next
   edit "CA_Cert_2"
   next
end
```

system admin-certificate local

The FortiWeb appliance presents its own HTTPS server certificate for secure connections (HTTPS) to its Web UI. By default, A Fortinet factory certificate is used as the certificate, which is named `defaultcert` in FortiWeb. You can also import other certifications to FortiWeb and replace the `defaultcert` with any of them for secure Web UI connections.

Use this command to edit the comment associated with the these FortiWeb's administration certificates that are stored locally on the FortiWeb appliance.

To replace the certificate that FortiWeb uses for the secure accesses to its Web UI, see .

For information on how to upload a certificate file to change FortiWeb's default certificate, see the *FortiWeb Administration Guide*:

http://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system admin-certificate local
  edit "<certificate_name>"
    set comment "<comment_str>"
    set certificate "<certificate_str>"
    set passwd "<passwd_str>"
    set private-key "<private-key_str>"
    set flag 0
    set status ok
    set type certificate
  next
end
```

Variable	Description	Default
`"<certificate_name>"`	Enter the name of a certificate file. The maximum length is 63 characters.	No default.
`comment "<comment_str>"`	Enter a description or other comment. If the comment contains more than one word or contains an apostrophe, surround the comment in double quotes (`"`). The maximum length is 127 characters.	No default.
`certificate "<certificate_str>"`	Enter the sequence number of the certificate file.	No default.
`passwd "<passwd_str>"`	When exporting the private key file from certificate factories, you can choose to enter a password to encrypt the file. Thus when you import the file into FortiWeb, you shall enter this password. This is optional.	No default.
`private-key "<private-key_str>"`	Enter the sequence number of the key file.	No default.
`flag 0`	Indicate if a password was saved. This is used by FortiWeb for backwards compatibility.	`0`
`status ok`	Indicates the status of an imported certificate: • `na`—Indicates that the certificate was successfully	`ok`

Variable	Description	Default
	imported, and is currently selected for use by the FortiWeb appliance. • `ok`—Indicates that the certificate was successfully imported but is not selected as the certificate currently in use. To use the certificate, see . • `pending`—Indicates that the certificate request was generated, but must be downloaded, signed, and imported before it can be used as a local certificate.	
`type certificate`	Indicates whether the file is a certificate or a certificate signing request (CSR).	`certificate`

Example

This example adds a comment to the certificate named `certificate1`.

```
config system admin-certificate local
   edit "certificate1"
      set comment "This is a certificate that FortiWeb uses for secure Web UI connections."
   next
end
```

system advanced

Use this command to configure several system-wide options that determine how FortiWeb scans traffic.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system advanced
   set circulate-url-decode {enable | disable}
   set decoding-enhancement {enable | disable}
   set max-cache-size <cache_int>
   set max-dlp-cache-size <percentage_int>
   set max-dos-alert-interval <seconds_int>
   set share-ip {enable | disable}
   set anypktstream {enable | disable}
end
```

Variable	Description	Default
`circulate-url-decode {enable | disable}`	Enable to detect URL-embedded attacks that are obfuscated using recursive URL encoding (that is, multiple levels' worth of URL encoding).	`enable`

Variable	Description	Default
	Encoded URLs can be legitimately used for non-English URLs, but can also be used to avoid detection of attacks that use special characters. Encoded URLs can now be decoded to scan for these types of attacks. Several encoding types are supported. For example, you could detect the character `A` that is encoded as either `%41`, `%x41`, `%u0041`, or `\t41`. Disable to decode only one level's worth of the URL, if encoded.	
`decoding-enhancement {enable | disable}`	Enable to decode cookies and parameters using base64 or CSS for specified URLs. To configure decoding enhancement, see `config system decoding enhancement` (page 234).	`disable`
`max-cache-size <cache_int>`	Type the maximum size (in KB) of the body of the HTTP response from the web server that FortiWeb will cache per URL for body compression, decompression, rewriting, and XML detection. Increasing the body cache may decrease performance. Valid values range from 32 to 4096. The default value is 64. Increasing the body cache may decrease performance.	`512`
`max-dlp-cache-size <percentage_int>`	Type the maximum percentage of `max-cache-size <cache_int>` (page 202)—the body of the HTTP response from the web server—that FortiWeb buffers and scans. Responses are cached to improve performance on compression, decompression, and rewriting on often-requested URLs.	`12`
`max-dos-alert-interval <seconds_int>`	Type the maximum amount of time that FortiWeb will converge into a single log message during a DoS attack or padding oracle attack.	`180`
`share-ip {enable | disable}`	Enable to analyze the ID field of IP headers in order to attempt to detect when multiple clients share the same source IP address. To configure the difference between packets' ID fields that FortiWeb will treat as a shared IP, see "system ip-detection" on page 288. Enabling this option is required for features that have a separate threshold for shared IP addresses, such as brute force login prevention. If you disable the option, those features will behave as if there is only a single threshold,	`disable`

Variable	Description	Default
	regardless of whether the source IP is shared by many clients.	
`anypktstream {enable | disable}`	Enable to configure FortiWeb to scan partial TCP connections. In some cases, FortiWeb is deployed after a client has already created a connection with a back-end server. If this option is disabled, FortiWeb ignores any traffic that is part of a pre-existing session.	`disable`

system antivirus

Use this command to configure system-wide FortiGuard Antivirus scan settings.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system antivirus
   set default-db {basic | extended}
   set scan-bzip2 {enable | disable}
   set uncomp-size-limit <limit_int>
   set uncomp-nest-limit <limit_int>
   set use-fsa {enable | disable}
end
```

Variable	Description	Default
`default-db {basic | extended}`	Select which of the antivirus signature databases to use when scanning HTTP `POST` requests for viruses, either: • `basic`—Select to use only the signatures of viruses and greyware that have been detected by FortiGuard's networks to be recently spreading in the wild. • `extended`—Select to use all signatures, regardless of	`basic`

Variable	Description	Default
	whether the viruses or greyware are currently spreading.	
`scan-bzip2 {enable | disable}`	Enable to scan archives that are compressed using the BZIP2 algorithm. **Tip:** Scanning BZIP2 archives can be very CPU-intensive. To improve performance, block the BZIP2 file type, then disable this option.	`enable`
`uncomp-size-limit <limit_int>`	Type the maximum size in kilobytes (KB) of the memory buffer that FortiWeb will use to temporarily undo the compression that a client or web server has applied to traffic, in order to inspect and/or modify it. For details, see "waf file-uncompress-rule" on page 1. **Caution:** Unless you configure otherwise, compressed requests that are too large for this buffer will pass through FortiWeb **without** scanning or rewriting. **This could allow malware to reach your web servers, and cause HTTP body rewriting to fail.** If you prefer to **block** requests greater than this buffer size, configure `waf http-protocol-parameter-restriction` (page 429). To be sure that it will not disrupt normal traffic, first configure `action` to be `alert`. If no problems occur, switch it to `alert_deny`. The maximum acceptable values are: 102400 KB: FortiWeb 100D, 400C, 400D, 600D, 1000C, 3000CFsx, 3000DFsx, 4000C 204800 KB: FortiWeb 1000D, 2000D, 3000D, 4000D, 1000E, 2000E, 3010E 358400 KB: FortiWeb 3000E, 4000E	5000
`uncomp-nest-limit <limit_int>`	Type the maximum number of allowed levels of compression (“nesting”) that FortiWeb will attempt to decompress.	`12`
`use-fsa {enable | disable}`	Enable to use the Signature Database from FortiSandbox to supplement the AV Signature Database. If enabled, FortiWeb will download the malware package from FortiSandbox's Signature Database every minute.	`disable`

system autoupdate override

Use this command to override the default Fortiguard Distribution Server (FDS).

If you cannot connect to the FortiGuard Distribution Network (FDN) or if your organization provides updates using their own FortiGuard server, you can override the FDS server setting so that the FortiWeb appliance connects to this server instead of the default server on Fortinet's public FDN.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system autoupdate override
  set status {enable | disable}
  set address {"<fds_fqdn>" | "<fds_ipv4>"}
  set fail-over {enable | disable}
end
```

Variable	Description	Default
`status {enable | disable}`	Enable to override the default list of FDN servers, and connect to a specific server.	`disable`
`address {"<fds_fqdn>" | "<fds_ipv4>"}`	Enter either the IP address or fully qualified domain name (FQDN) of the FDS override.	No default.
`fail-over {enable | disable}`	Enable to fail over to one of the public FDN servers if FortiWeb cannot reach the server specified in your FDS override.	`enable`

Related topics

- "system autoupdate schedule" on page 205

system autoupdate schedule

Use this command to configure how the FortiWeb appliance will access the Fortinet Distribution Network (FDN) to retrieve updates. The FDN is a world-wide network that delivers FortiGuard service updates of predefined robots, data types, suspicious URLS, IP address reputations, and attack signatures used to detect attacks such as:

- Cross-site scripting (XSS)
- SQL injection
- Common exploits

Alternatively, you can manually upload update packages. For details, see the FortiWeb Administration Guide:

http://docs.fortinet.com/fortiweb/admin-guides

FortiWeb appliances connect to the FDN by connecting to the Fortinet Distribution Server (FDS) nearest to the FortiWeb appliance based on its configured time zone.

In addition to manual update requests, FortiWeb appliances support an automatic scheduled updates, by which the FortiWeb appliance periodically polls the FDN to determine if there are any available updates.

If you want to connect to a specific FDS, you must enter `config system autoupdate override` (page 204). If your FortiWeb appliance must connect through a web proxy, you must also enter `config system autoupdate tunneling` (page 207).

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system autoupdate schedule
   set status {enable | disable}
   set frequency {daily | every | weekly}
   set time "<time_str>"
   set day {Sunday | Monday | Tuesday | Wednesday | Thursday | Friday | Saturday}
end
```

Variable	Description	Default
`status {enable | disable}`	Enable to periodically request signature updates from the FDN.	`disable`
`frequency {daily | every | weekly}`	Select the frequency with which the FortiWeb appliance will request signature updates.	`every`
`time "<time_str>"`	Enter the time at which the FortiWeb appliance will request signature updates. The time format is `hh:mm`, where: • `hh` is the hour according to a 24-hour clock • `mm` is the minute	`00:00`
`day {Sunday | Monday | Tuesday | Wednesday | Thursday | Friday | Saturday}`	Select which day of the week that the FortiWeb appliance will request signature updates. This option applies only if `frequency` is `weekly`.	`Monday`

Example

This example configures weekly signature update requests on Sunday at 2:00 PM.

```
config system autoupdate schedule
   set status enable
   set frequency weekly
   set day Sunday
   set time 14:00
end
```

Related topics

system autoupdate tunneling

Use this command to configure the FortiWeb appliance to use a proxy server to connect to the Fortinet Distribution Network (FDN).

The FortiWeb appliance will connect to the proxy using the HTTP `CONNECT` method, as described in RFC 2616 (http://tools.ietf.org/rfc/rfc2616.txt).

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system autoupdate tunneling
  set status {enable | disable}
  set address {"<proxy_fqdn>" | "<proxy_ipv4>"}
  set port <port_int>
  set username "<proxy-user_str>"
  set password "<proxy-password_str>"
end
```

Variable	Description	Default
`status {enable | disable}`	Enable to connect to the FDN through a web proxy.	`disable`
`address {"<proxy_fqdn>" | "<proxy_ipv4>"}`	Enter either the IP address or fully qualified domain name (FQDN) of the web proxy. The maximum length is 63 characters.	No default.
`port <port_int>`	Enter the port number on which the web proxy listens for connections. The valid range is 0–65,535.	`0`
`username "<proxy-user_str>"`	If the proxy requires authentication, enter the FortiWeb appliance's login name on the web proxy. The maximum length is 49 characters.	No default.
`password "<proxy-password_str>"`	If the proxy requires authentication, enter the password for the FortiWeb appliance's login name on the web proxy. The maximum length is 49 characters.	No default.

Example

This example configures the FortiWeb appliance to connect through a web proxy that requires authentication.

```
config system autoupdate tunneling
```

```
    set status enable
    set address "192.168.1.10"
    set port 1443
    set username "fortiweb"
    set password "myPassword1"
end
```

system backup

Use this command to configure automatic backups of the system configuration to an FTP or SFTP server. You can either run the backup immediately or schedule it to run periodically.

The backup can include all uploaded files such as error pages, WSDL files, certificates, and private keys. Fortinet recommends that if you have many such files, that you include them in the backup. This saves you valuable time if you need to restore the configuration in an emergency.

Fortinet strongly recommends that you password-encrypt this backup, and store it in a secure location. This backup method includes sensitive data such as your HTTPS certificates' private keys. Unauthorized access to private keys compromises the security of all HTTPS requests using those certificates.

To restore a backup, see "backup full-config" on page 642.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system backup
   edit "<backup_name>"
      set config-type {full-config |cli-config | waf-config}
      set encryption {enable | disable}
      set encryption-passwd "<password_str>"
      set ftp-auth {enable | disable}
      set ftp-user "<user_str>"
      set ftp-passwd "<password_str>"
      set ftp-dir "<directory-path_str>"
      set ftp-server {"<server_ipv4>" | "<server_fqdn>"}
      set protocol-type {ftp | sftp}
      set schedule_type {now | days}
      set schedule_days {sun mon tue wed thu fri sat}
      set schedule_time "<time_str>"
   next
end
```

Variable	Description	Default
"<backup_name>"	Enter the name of the backup configuration. The maximum length is 59 characters. To display the list of existing backups, enter: edit ?	No default.
config-type {full-config |cli-config | waf-config}	Select either: • full-config — Include both the configuration file and other uploaded files, such a certificate and error page files, in the backup. • cli-config — Include only the configuration file in the backup. • waf-config — Include only the web protection profiles in the backup.	cli-config
encryption {enable | disable}	Enable to encrypt the backup file with a .zip extension. **Caution:** Unlike when downloading a backup from the web UI to your computer, this **does** include all certificates and private keys. Fortinet strongly recommends that you password-encrypt this backup, and store it in a secure location.	disable
encryption-passwd "<password_str>"	Enter the password that will be used to encrypt the backup file. This field appears only if you enable encryption {enable | disable} (page 209).	
ftp-auth {enable | disable}	Enable if the server requires that you provide a user name and password for authentication, rather than allowing anonymous connections. When enabled, you must also configure ftp-user "<user_str>" (page 209) and ftp-passwd "<password_str>" (page 209). Disable for FTP servers that allow anonymous uploads.	disable
ftp-user "<user_str>"	Enter the user name that the FortiWeb appliance will use to authenticate with the server. The maximum length is 127 characters. This variable is not available unless ftp-auth {enable | disable} (page 209) is enable.	No default.
ftp-passwd "<password_str>"	Enter the password corresponding to the account specified in ftp-user "<user_str>". The maximum length is 127 characters.	No default.

Variable	Description	Default
	This variable is not available unless `ftp-auth {enable | disable}` (page 209) is `enable`.	
`ftp-dir "<directory-path_str>"`	Enter the directory path on the server where you want to store the backup file. The maximum length is 127 characters.	No default.
`ftp-server {"<server_ipv4>" | "<server_fqdn>"}`	Enter either the IP address or fully qualified domain name (FQDN) of the server. The maximum length is 127 characters.	No default.
`protocol-type {ftp | sftp}`	Select whether to connect to the server using FTP or SFTP.	`ftp`
`schedule_type {now | days}`	Select one of the schedule types: • `now`—Use this to initiate the FTP backup immediately upon ending the command sequence. • `days`—Enter this to allow you to set days and a time to run the backup automatically. You must also configure `schedule_days {sun mon tue wed thu fri sat}` (page 210) and `schedule_time "<time_str>"` (page 210)	`now`
`schedule_days {sun mon tue wed thu fri sat}`	Enter one or more days of the week when you want to run a periodic backup. Separate each day with a blank space. For example, to back up the configuration on Monday and Friday, enter: `set schedule_days mon,fri` This command is available only if `schedule_type {now | days}` (page 210) is `days`.	No default.
`schedule_time "<time_str>"`	Enter the time of day to run the backup. The time format is `hh:mm`, where: • `hh` is the hour according to a 24-hour clock • `mm` is the minute This command is available only if "schedule_type {now | days}" on page 210 is `days`.	`00:00`

Example

This example configures a scheduled, full configuration backup every Sunday and Friday at 1:15 AM. The FortiWeb appliance authenticates with the FTP server using an account named `fortiweb1` and its password, `P@ssword1`. It does not encrypt the backup file.

```
config system backup
  edit "Scheduled_Backup"
    set config-type full-config
```

```
      set protocol-type ftp
      set ftp-auth enable
      set ftp-user "fortiweb1"
      set ftp-passwd "P@ssword1"
      set ftp-server "172.20.120.01"
      set ftp-dir "/config-backups"
      set schedule_type days
      set schedule_days sun,fri
      set schedule_time "01:15"
  next
end
```

Related topics

- "restore config" on page 662

system central-management

Use this command to enable cross domain access feature for central management in the web UI and CLI.

Syntax

```
config system central management
  set cm-access {enable | disable}
  set system central-management

end
```

Variable	Description	Default
`cm-access {enable | disable}`	Enable/disable the cross domain access feature for central management.	`disable`
`system central-management`	Enter the URL to access FortiWeb Manager.	`disable`

Example

This example shows enabling central management feature.

```
config system central-management
  set cm-accsss enable
  set allow-origin https://10.200.111.100

end
```

system certificate ca

Use this command to show the names of certificates for a certificate authority (CA). You use the web UI to upload these certificates.

Certificate authorities validate and sign other certificates in order to indicate to third parties that those other certificates are authentic and can be trusted

CA certificates are not used directly, but must first be grouped in order to be selected in a certificate verification rule. For details, see "system certificate ca-group" on page 213.

For information on how to upload a certificate file, see the FortiWeb Administration Guide:

http://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
show system certificate ca
config system certificate ca
   edit "<certificate_name>"
      set certificate "<certificate_ str>"
   next
end
```

Variable	Description	Default
`"<certificate_name>"`	Enter the name of a certificate file. The maximum length is 63 characters.	No default.
`certificate "<certificate_ str>"`	Set the certificate. Only certificates in PEM format may be set.	No default.

Example

This example creates two CA certificate items, `CA_Cert_1` and `CA_Cert_2`.

```
config system certificate ca
   edit "CA_Cert_1"
   next
   edit "CA_Cert_2"
   next
end
```

This example adds a certificate to `CA_Cert_1`

```
config system certificate local
   edit "CA_Cert_1"
   set certificate "-----BEGIN CERTIFICATE-----
```

```

- "system certificate verify" on page 229

system certificate ca-group

Use this command to group certificate authorities (CA).

CAs must belong to a group in order to be selected in a certificate verification rule.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system certificate ca-group
   edit "<ca-group_name>"
      config members
         edit <ca_index>
            set type {CA | TSL}
            set publish-dn {enable | disable}
            set tsl "<tsl_name>"
            set name "<ca_name>"

         next
      end
   next
end
```

Variable	Description	Default
"<ca-group_name>"	Enter the name of a certificate authority (CA) group. The maximum length is 63 characters.	No default.
<ca_index>	Enter the index number of a CA within its group. The valid range is 1–999,999,999,999,999,999.	No default.
name "<ca_name>"	Enter the name of a previously uploaded CA certificate.	No default.
type {CA | TSL}	Select to upload CA certificate or TSL.	CA
tsl "<tsl_name>"	Enter the name of a TSL.	No default.
publish-dn {enable | disable}	Enable to list only certificates related to the specified CA Group. This is beneficial when a client installs many certificates in its browser or when apps don't list client certificates. If you enable this option, also enable the option in a certificate verification rule. For details, see "system certificate verify" on page 229.	enable

Example

This example groups two CA certificates into a CA group named caVEndors1.

```
config system certificate ca-group
   edit "caVendors1"
      config members
         edit 1
            set name "CA_Cert_1"
         next
         edit 2
            set "name CA_Cert_2"
         next
      end
   next
end
```

- "certificate ca" on page 1
- "system certificate local" on page 219
- "system certificate verify" on page 229

system certificate crl

Use this command to edit the URL associated with a previously uploaded certificate revocation list (CRL).

To ensure that your FortiWeb appliance validates only certificates that have not been revoked, you should periodically upload a current certificate revocation list, which may be provided by certificate authorities (CA).

For information on how to upload a CRL, see the FortiWeb Administration Guide:

http://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system certificate crl
   edit "<crl_name>"
      set certificate "<certificate_str>"
      set type {http | local | scep}
      set url "<crl_str>"
   next
end
```

Variable	Description	Default
`"<crl_name>"`	Enter the name of a CRL. The maximum length is 63 characters.	No default.
`certificate "<certificate_str>"`	Set the certificate. Only certificates in PEM format may be set.	No default.
`type {http | local | scep}`	Specify how you set the certificate. `http`—query for the certificate from a HTTP server `local`—set the certificate through certificate <certificate_str_ pem>. `scep`—query for the certificate from a SCEP server	`local`
`url "<crl_str>"`	If `type {http | local | scep}` (page 215) is set as `http` or `scep`, enter the URL of the certificate. The maximum length is 127 characters.	No default.

- "system certificate verify" on page 229

system certificate crl-group

Use this command to create a group of CRLs that you have already uploaded to FortiWeb.

To ensure that FortiWeb validates only certificates that have not been revoked, you should periodically upload current certificate revocation lists (CRL) that may be provided by certificate authorities (CA). Once you've uploaded the CRL(s) you want to use, create CRL groups to include in your FortiWeb configuration.

For more information about CRLs and CRL groups, see the *FortiWeb Administration Guide*:

http://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system certificate crl-group
   edit <crl_group_name>
   config members
      edit <entry_index>
         set <crl_name>
      next
   end
   next
end
```

Variable	Description	Default
`<crl_group_name>`	Type the name of the CRL group. You will use this name to select the CRL group in other parts of the configuration. The maximum length is 63 characters.	No default.
`<entry_index>`	Type the index number of the individual entry in the table.	No default.
`<crl_name>`	Type the name of a CRL that you want to include in the group. The maximum length is 63 characters. For details, see "system certificate crl" on page 214.	No default.

Related topics

- "system certificate crl" on page 214
- "system certificate verify" on page 229

system certificate intermediate-certificate

Use this command to show the names of uploaded intermediate CA certificate. You upload these certificates using the web UI.

For information on how to upload an intermediate certificate file, see the FortiWeb Administration Guide:

http://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
show system certificate intermediate-certificate
config system certificate intermediate-certificate
   edit "<certificate_name>"
      set certificate "<certificate_str>"
   next
end
```

Variable	Description	Default
`"<certificate_name>"`	Enter the name of a certificate file. The maximum length is 63 characters.	No default.
`certificate "<certificate_str>"`	Set the certificate. Only certificates in PEM format may be set.	No default.

Example

This example creates three intermediate certificate items, `Inter_Cert_1`, `Inter_Cert_2` and `Inter_Cert_3`.

```
config system certificate intermediate-certificate
   edit "Inter_Cert_1"
   next
   edit "Inter_Cert_2"
   next
   edit "Inter_Cert_3"
   next
end
```

This example adds a certificate to `Inter_Cert_1`

```
config system certificate local
   edit "Inter_Cert_1"
   set certificate "-----BEGIN CERTIFICATE-----
   MIIDkjCCAnoCCQCbXq6VYR1CijANBgkqhkiG9w0BAQUFADCBijELMAkGA1UEBhMC

- "system certificate intermediate-certificate-group" on page 218
- "server-policy policy" on page 136

system certificate intermediate-certificate-group

Use this command to group intermediate CA certificates.

Intermediate CAs must belong to a group in order to be selected in a certificate verification rule.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system certificate intermediate-certificate-group
  edit "<intermediate-ca-group_name>"
    config members
      edit <intermediate-ca_index>
        set name "<ca_name>"
      next
    end
  next
end
```

Variable	Description	Default
`"<intermediate-ca-group_name>"`	Enter the name of an intermediate certificate authority (CA) group. The maximum length is 63 characters.	No default.
`<intermediate-ca_index>`	Enter the index number of an intermediate CA within its group. The valid range is 1–9,999,999,999,999,999,999.	No default.
`name "<ca_name>"`	Enter the name of a previously uploaded intermediate CA certificate. The maximum length is 63 characters.	No default.

system certificate local

Use this command to edit the comment associated with a server certificate that is stored locally on the FortiWeb appliance.

You can also configure settings for a certificate that works with an HSM (hardware security module). For details about HSM integration, see "system hsm info" on page 278 and the FortiWeb Administration Guide:

http://docs.fortinet.com/fortiweb/admin-guides

FortiWeb appliances require these certificates to present when clients request secure connections, including when:

- Administrators connect to the web UI (HTTPS connections only)
- Web clients use SSL or TLS to connect to a virtual server, if you have enabled SSL off-loading in the policy (HTTPS connections and Reverse Proxy mode)
- Web clients use SSL or TLS to connect to a physical server (HTTPS connections and true transparent mode)

FortiWeb appliances also require certificates in order to decrypt and scan HTTPS connections travelling through it if operating in Offline Protection or Transparent Inspection modes.

Which certificate will be used, and how, depends on the purpose.

- For connections to the web UI, the FortiWeb appliance presents its default certificate. The FortiWeb appliance's default certificate does not appear in the list of local certificates. It's used only for connections to the web UI and cannot be removed.
- For SSL off-loading or SSL decryption, upload certificates that do **not** belong to the FortiWeb appliance, but instead belong to the protected hosts. Then, select which one the FortiWeb appliance will use when configuring the SSL option in a policy or server farm.

For information on how to upload a certificate file, see the FortiWeb Administration Guide:

http://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system certificate local
   edit "<certificate_name>"
      set comment "<comment_str>"
      set status {na | ok | pending}
      set type {certificate | csr}
      set flag {0 | 1}
      set is-hsm {no | yes}
      set partition-number "<partition_name>"
      set certificate "<certificate_str>"
      set private-key "<private_key_str>"
      set passwd "<password>"
   next
end
```

Variable	Description	Default
"<certificate_name>"	Enter the name of a certificate file. The maximum length is 63 characters.	No default.
comment "<comment_str>"	Enter a description or other comment. If the comment contains more than one word or contains an apostrophe, surround the comment in double quotes ("). The maximum length is 127 characters.	No default.
status {na | ok | pending}	Indicate the status of an imported certificate: • na—Indicates that the certificate was successfully imported, and is currently selected for use by the FortiWeb appliance. • ok—Indicates that the certificate was successfully imported but is not selected as the certificate currently in use. To use the certificate, select it in a policy or server farm. • pending—Indicates that the certificate request was generated, but must be downloaded, signed, and imported before it can be used as a local certificate.	No default.
type {certificate | csr}	Indicate whether the file is a certificate or a certificate signing request (CSR).	No default.
flag {0 | 1}	Indicate if a password was saved. This is used by FortiWeb for backwards compatibility.	No default.
is-hsm {no | yes}	Specify whether you configured the CSR for this certificate to work with an integrated HSM.	no
partition-number "<partition_name>"	Enter the name of the HSM partition you selected when you created the CSR for this certificate.	No default.
certificate "<certificate_str>"	Set the certificate. Only certificates in PEM format may be set.	No default.
private-key "<private_key_str>"	Set the private key for the certificate. Only private keys in PEM format may be set.	No default.
passwd "<password>"	Enter the password for the certificate.	No default.

Example

This example adds a comment to the certificate named certificate1.

```
config system certificate local
  edit "certificate1"
    set comment "This is a certificate for the host www.example.com."
  next
end
```

This example adds a certificate named `certificate2`

```
config system certificate local
  edit "certificate2"
  set private-key "-----BEGIN RSA PRIVATE KEY-----

system certificate multi-local

Use this command to configure RSA, DSA, and ECDSA certificates into multi-certificate, and reference them in server policy in Reverse Proxy mode and pserver in TTP or WCCP mode.

Syntax

config system certificate multi-local

edit "system certificate multi-local" on page 222

set "system certificate multi-local" on page 222

set "system certificate multi-local" on page 222

set "system certificate multi-local" on page 222

set "system certificate multi-local" on page 222

next

end

Variable	Description	Default
"<certificate-multi-local_name>"	Enter the name of a multi-certificate file.	No default.
comment "<comment_str>"	Enter a description or other comment.	No default.
rsa-cert <rsa-cert_str>	Select the RSA certificate created in `system certificate local` (page 1).	No default.
dsa-cert <dsa-cert_str>	Select the DSA certificate created in `system certificate local` (page 1).	No default.
ecc-cert <ecc-cert_str>	Select the ECDSA certificate created in `system certificate local` (page 1).	No default.

system certificate offline-sni

The offline SNI is used in pserver of server pool in Offline Inspection mode or Transparent Inspection mode. FortiWeb uses the server certificate to decrypt SSL-secured connections for the website specified by domain.

Not all web browsers support SNI. Go to the following location for a list of web browsers that support SNI:

http://en.wikipedia.org/wiki/Server_Name_Indication#Browsers_with_support_for_TLS_server_name_indication.5B10.5D

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system certificate offline-sni
  edit "<offline-sni_name>"
    config members
      edit "system certificate offline-sni" on page 223
        set "system certificate offline-sni" on page 223
        set domain "<server_fqdn>"
        set local-cert "<local-cert_name>"
      end
    next
end
```

Variable	Description	Default
`"<offline-sni_name>"`	Enter the name of an offline Server Name Indication (SNI) configuration.	No default.
`<entry_index>`	Enter the index number of an offline SNI configuration entry. The valid range is 1–9,999,999,999,999,999,999.	No default.
`domain-type {plain | regular}`	Specify `plain` to match a domain to certificates using a literal domain specified in `domain "<server_fqdn>"`. Specify `regular` to match multiple domains to certificates using a regular expression specified in `domain "<server_fqdn>"`.	`plain`
`domain "<server_fqdn>"`	Enter the domain of the secure website (HTTPS) that uses the certificate specified by `local-cert "<local-cert_name>"` (page 223). Enter a literal domain if `domain-type {plain | regular}` (page 223) is set to `plain`; or enter a regular expression if `domain-type` is set to `regular`.	No default.
`local-cert "<local-cert_name>"`	Enter the name of the server certificate that FortiWeb uses to decrypt SSL-secured connections for the website specified by `domain "<server_fqdn>"` (page 223).	No default.

system certificate remote

Use this command to configure an OCSP server.

Once an OCSP server is configured, OCSP stapling may be enabled. When OCSP stapling is enabled, FortiWeb periodically fetches the revocation status of the specified certificate from the OCSP server and caches the response for a period if the revocation status is contained in the response.

For more information on OCSP stapling, see the *FortiWeb Administration Guide*:

http://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system certificate remote
  edit "<ocsp_name>"
    set certificate "<certificate_name>"
    set comment "<comment_str>"
    set ocsp_url "<url>"
  next
end
```

Variable	Description	Default
`"<ocsp_name>"`	Enter the name of an OCSP group. The maximum length is 63 characters. This group can be used if OCSP stapling is enabled in a server policy.	No default
`certificate "<certificate_name>"`	A CA certificate that has been imported in FortiWeb.	No default
`comment "<comment_str>"`	Optionally, enter a comment for the OCSP group.	No default
`ocsp_url "<url>"`	Enter URL of the OCSP server corresponding to the specified CA certificate.	No default

Example

This example creates an OCSP group for the CA certificate `CA_Cert_1`.

```
config system certificate remote
```

```
    edit ocsp_ca_cert_1
       set certificate "CA_Cert_1"
       set comment "OCSP for CA_Cert_1"
       set ocsp_url "http://ocsp.example.com"
    next
end
```

system certificate server-certificate-verify

Use this command to configure how the FortiWeb appliance will verify certificates presented by HTTP server.

Syntax

```
config system certificate server-certificate-verify
   edit "<certificate_verificator_name>"
      set ca "<ca-group_name>"
      set crl "<crl-group_name>"
   next
end
```

Variable	Description	Default
"<certificate_ verificator_name>"	Enter the name of a certificate verifier. The maximum length is 63 characters.	No default.
ca "<ca-group_name>"	Enter the name of an existing CA Group that you want to use to authenticate client certificates.	No default.
crl "<crl-group_name>"	Enter the name of an existing CRL Group, if any, to use to verify the revocation status of client certificates.	No default.

Related topics

- "system certificate ca-group" on page 213
- "system certificate crl" on page 214

system certificate sni

In some cases, the members of a server pool or a single pool member host multiple secure websites that use different certificates. Use this command to create a Server Name Indication (SNI) configuration that identifies the certificate to use by domain.

You can select a SNI configuration in a server policy only when the operating mode is Reverse Proxy mode and an HTTPS configuration is applied to the policy.

Not all web browsers support SNI. Go to the following location for a list of web browsers that support SNI:

http://en.wikipedia.org/wiki/Server_Name_Indication#Browsers_with_support_for_TLS_server_name_indication.5B10.5D

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system certificate sni
   edit "<sni_name>"
      config members
         edit <entry_index>
            set domain-type {plain | regular}
            set domain "<server_fqdn>"
            set multi-local-cert {enable | disable}
            set multi-local-cert-group <multi-local-cert-group_name>
            set local-cert "<local-cert_name>"
            set inter-group "<intermediate-cagroup_name>"
            set verify "<certificate_verificator_name>"
         end
      next
end
```

Variable	Description	Default
`"<sni_name>"`	Enter the name of an Server Name Indication (SNI) configuration.	No default.
`<entry_index>`	Enter the index number of an SNI configuration entry. The valid range is 1–9,999,999,999,999,999,999.	No default.
`domain-type {plain | regular}`	Specify `plain` to match a domain to certificates using a literal domain specified in `domain`. Specify `regular` to match multiple domains to certificates using a regular expression specified in `domain`.	`plain`
`domain "<server_fqdn>"`	Enter the domain of the secure website (HTTPS) that uses the certificate specified by `local-cert "<local-cert_name>"` (page 227). Enter a literal domain if `domain-type {plain |`	No default.

Variable	Description	Default
	`regular}` (page 226) is set to `plain`; or enter a regular expression if `domain-type` is set to `regular`.	
`multi-local-cert {enable | disable}`	Enable this option to allow FortiWeb to use multiple local certificates.	`disable`
`multi-local-cert-group <multi-local-cert-group_name>`	Select the created multi-certificate file.	No default.
`local-cert "<local-cert_name>"`	Enter the name of the server certificate that FortiWeb uses to encrypt or decrypt SSL-secured connections for the website specified by `domain "<server_fqdn>"` (page 226).	No default.
`inter-group "<intermediate-cagroup_name>"`	Enter the name of a group of intermediate certificate authority (CA) certificates, if any, that FortiWeb presents to validate the CA signature of the certificate specified by `local-cert "<local-cert_name>"` (page 227). If clients receive certificate warnings that an intermediary CA has signed the server certificate configured in `local-cert "<local-cert_name>"` (page 227), rather than by a root CA or other CA currently trusted by the client directly, configure this option. Alternatively, include the entire signing chain in the server certificate itself before uploading it to the FortiWeb appliance, thereby completing the chain of trust with a CA already known to the client. See the FortiWeb Administration Guide: http://docs.fortinet.com/fortiweb/admin-guides	No default.
`verify "<certificate_verificator_name>"`	Enter the name of a certificate verifier, if any, that FortiWeb uses when an HTTP client presents its personal certificate. If you do not select one, the client is not required to present a personal certificate. Personal certificates, sometimes also called user certificates, establish the identity of the person connecting to the website (PKI authentication). You can require that clients present a certificate alternatively or in addition to HTTP authentication. For details, see "waf http-authen http-authen-rule" on page 417. To display the list of existing verifiers, enter: `edit ?` **Note:** The client must support TLS 1.0.	No default.

system certificate tsl-ca

Use this command to show the names of Trust Service Lists (TSL) for a certificate authority (CA). You use the web UI to upload the TSL.

For information on how to upload a TSL, see the FortiWeb Administration Guide:

http://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system certificate tsl-ca
  edit "<tsl-ca_name>"
    set type {file | url}
    set distribute-url
  next
end
```

Variable	Description	Default
`"<tsl-ca_name>"`	Enter the name of a TSL.	No default
`type {file | url}`	Select the way to upload a TSL.	No default
`distribute-url`	Enter the distribution URL of the TSL.	No default

Related topics

- system certificate ca
- system certificate ca-group

system certificate urlcert

Use this command to configure the URL-based client certificate feature for a server policy or server pool. This feature allows you to require a certificate for some requests and not for others. Whether a client is required to present a personal certificate or not is based on the requested URL and the rules you specify in the URL-based client certificate group.

A URL-based client certificate group specifies the URLs to match and whether the matched request is required to present a certificate or exempt from presenting a certificate.

When the URL-based client certificate feature is enabled, clients are not required to present a certificate if the request URL is specified as exempt in the URL-based client certificate group rule or URL of the request does not match a rule.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system certificate urlcert
   edit "<url-cert-group_name>"
      config list
         edit <entry_index>
            set url "<url_str>"
            set require {enable | disable}
         end
      next
end
```

Variable	Description	Default
`"<url-cert-group_name>"`	Enter the name for the URL-based client certificate group.	No default.
`<entry_index>`	Enter the index number of an URL-based client certificate group entry.	No default.
`url "<url_str>"`	Enter a URL to match. When the URL of a client request matches this value and the value of `require` is `enable`, FortiWeb requires the client to present a private certificate.	No default.
`require {enable | disable}`	Specify whether client requests with the URL specified by `url` are required to present a personal certificate. When you select `disable`, FortiWeb does not require client requests with the specified URL to present a personal certificate.	No default.

Related topics

system certificate verify

Use this command to configure how the FortiWeb appliance will verify certificates presented by HTTP clients.

To apply a certificate verification rule, select it in a policy. For details, see "server-policy policy" on page 136.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system certificate verify
  edit "<certificate_verificator_name>"
    set ca "<ca-group_name>"
    set crl "<crl-group_name>"
    set publish-dn {enable | disable}
    set strictly-need-cert {enable | disable}
  next
end
```

Variable	Description	Default
`"<certificate_verificator_name>"`	Enter the name of a certificate verifier. The maximum length is 63 characters.	No default.
`ca "<ca-group_name>"`	Enter the name of an existing CA Group that you want to use to authenticate client certificates.	No default.
`crl "<crl-group_name>"`	Enter the name of an existing CRL Group, if any, to use to verify the revocation status of client certificates.	No default.
`publish-dn {enable | disable}`	Enable to list only certificates related to the specified CA Group. This is beneficial when a client installs many certificates in its browser or when apps don't list client certificates. If you enable this option, also enable the option in a CA Group. For details, see "system certificate ca-group" on page 213.	`disable`
`strictly-need-cert {enable | disable}`	Enable to strictly require verifying the client certificate.	`enable`

Related topics

- "server-policy server-pool" on page 161

system conf-sync

Use this command to configure non-HA configuration synchronization settings.

This command configures, but does **not** execute, the synchronization. To do this, use the web UI.

This command works only when administrative domains (ADOMs) are disabled.

This type of synchronization is used between FortiWeb appliances that are not part of a native FortiWeb high availability (HA) pair, such as when you need to clone the configuration once, or when HA is provided by an external device.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system conf-sync
   set ip "<remote-fortiweb_ipv4>"
   set password "<password_str>"
   set sync-type {full-sync | partial-sync}
   set server-port <port_int>
   set auto-sync {enable | disable}
   set frequency {daily | every | weekly}
   set day {Friday | Monday | Saturday | Sunday | Thursday | Tuesday | Wednesday}
   set time "<hh:mm>"
end
```

Variable	Description	Default
`ip "<remote-fortiweb_ipv4>"`	Enter the IP address of the remote FortiWeb appliance that you want to synchronize with the local FortiWeb appliance.	`0.0.0.0`
`password "<password_str>"`	Type the administrator password for the remote FortiWeb appliance. The maximum length is 63 characters.	No default.
`sync-type {full-sync | partial-sync}`	Select one of the synchronization types. For all operation modes except WCCP, `full-sync` updates the entire configuration of the peer FortiWeb appliance **except for** the following items: • Network interface used for synchronization (prevents sync from accidentally breaking connectivity with future syncs) • Administrator accounts • Access profiles • HA settings For the WCCP operation mode, `full-sync` updates the entire configuration **except for** the following items: • `config system interface` • `config route static` • `config route policy` • `config system wccp`	`partial-sync`

Variable	Description	Default

	• Administrator accounts
	• Access profiles
	• HA settings
	For all operation modes, `partial-sync` updates the configuration of the peer FortiWeb appliance, **except for** the following items:
	`router ...`
	`server-policy health`
	`server-policy http-content-routing-policy`
	`server-policy persistence-policy`
	`server-policy policy`
	`server-policy server-pool`
	`server-policy service custom`
	`server-policy service predefined`
	`server-policy vserver`
	`system ...`	

`server-port <port_int>`	Type the port number of the remote (peer) FortiWeb appliance that is used to connect to the local appliance for configuration synchronization. The valid range is from 1 to 65,535. **Caution:** The port number used with this command must be different than the port number used with the command or the submitting operation will fail.	`955`
`auto-sync {enable | disable}`	Enable to automatically synchronize the configurations hourly, daily, or weekly. Also configure the `frequency`, `day`, and `time` commands accordingly.	`disable`
`frequency {daily | every | weekly}`	Enter how often you want the configurations to synchronize: • `daily`—Synchronizes the configuration every day at a specified time. Also configure the `day` and `time` commands. For example, Selecting `10:30` will synchronize the configurations every day at 10:30. • `every`—Synchronizes the configuration after an interval you set using the `time` command. For example, entering `05:00` for the `time` command will synchronize the configurations every five hours. • `weekly`—Synchronizes the configuration on a specific day and time. For example, selecting `Sunday` for `day` and `5:15` for `time` will synchronize the configurations every Sunday at 5:15.	No default.

Variable	Description	Default
`day {Friday | Monday | Saturday | Sunday | Thursday | Tuesday | Wednesday}`	If `auto-sync` is enabled and the `frequency` is set to `weekly`, enter the day of the week on which you want the configurations to synchronize.	No default.
`time "<hh:mm>"`	Enter the time of day or interval at which the configurations will be synchronized: • `daily`—Sets the time of day at which the configurations will be synchronized. • `every`—Sets the interval at which the configurations will be synchronized. • `weekly`—Sets the time of day at which the configurations will be synchronized.	No default.

Related topics

- "system settings" on page 298

system console

Use this command to configure the management console settings. Usually this is set during the early stages of installation and needs no adjustment.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system console
  set baudrate {9600 | 19200 | 38400 | 57600 | 115200}
  set mode {batch | line}
  set output {more | standard}
  set shell {cli | sh}
end
```

Variable	Description	Default
`baudrate {9600 | 19200 | 38400 | 57600 | 115200}`	Select the baud rate of the console connection. The rate should conform to the specifications of your specific FortiWeb appliance.	`9600`
`mode {batch | line}`	Select the console input mode: either batch or line.	`line`
`output {more | standard}`	Select either:	`standard`

Variable	Description	Default
	• `more`—When displaying multiple pages' worth of output, pause after displaying each page's worth of text. When the display pauses, the last line displays `--More--`. You can then either: • Press the spacebar to display the next page. • Type `Q` to truncate the output and return to the command prompt. • `standard`—Do not pause between pages' worth of output, and do not offer to truncate output.	
`shell {cli | sh}`	Select either: • `cli`—Command-line shell. • `sh`—Busybox shell.	cli

Example

This example configures the local console connection to operate at 9,600 baud, and to show long output in a paged format.

```
config system console
   set baudrate 9600
   set output more
end
```

system decoding enhancement

Use this command to configure decoding enhancement. You can decode cookies and parameters using base64 or CSS for specified URLs.

To configure decoding enhancement, you must first enable the feature. For details, see "system advanced" on page 201.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system decoding-enhancement
   edit <entry_index>
      set url-type {plain | regular}
      set url-pattern "<url_string>"
      config field-list
         edit <entry_index>
            set base64-decoding {enable | disable}
```

```
            set css-decoding {enable | disable}
            set field-name "<parameter_cookie_str>"
            set field-name-type {plain | regular}
            set field-type {parameter | cookie}
          next
        end
      next
    end
```

Variable	Description	Default
`<entry_index>`	Enter the index number of the decoding rule that you want to create or modify.	No default.
`url-type {plain | regular}`	Enter to select between: • `plain`—A simple string; a string of text that contains a literal URL. • `regular`—A regular expression; a string of text that defines a search pattern for a URL that may come in many variations.	No default.
`url-pattern "<url_string>"`	Enter the URL path for which you want the decoding rule to apply.	No default.
`<entry_index>`	Enter the index number of the field that you want to create or modify.	No default.
`base64-decoding {enable | disable}`	Configure to enable Base64 decoding for the field.	`disable`
`css-decoding {enable | disable}`	Configure to enable CSS decoding for the field.	`disable`
`field-name "<parameter_cookie_str>"`	Enter the parameter or cookie string for the field.	No default.
`field-name-type {plain | regular}`	Enter to select between: • `plain`—A simple string; a string of text that contains a literal URL. • `regular`—A regular expression; a string of text that defines a search pattern for a URL that may come in many variations.	No default.
`field-type {parameter | cookie}`	Enter to select between: • parameter—Enter to set a parameter field for the field. • cookie—Enter to set a cookie field for the field.	No default.

Example

This example enables decoding enhancement and creates a decoding rule with a parameter field type.

```
config system advanced
```

```
    set decoding-enhancement enable
  end
  config system decoding-enhancement
    edit 1
      set url-type plain
      set url-pattern "/decoding"
      config field-list
        edit 1
          set base64-decoding enable
          set css-decoding enable
          set field-type parameter
          set field-name-type plain
          set field-name key
        next
      end
    next
  end
```

Related Topic(s)

- "system advanced" on page 201

system device-tracking

Use this command to adjust device tracking settings. FortiWeb's device tracking feature identifies suspected attackers based on the computers they are using.

For information on device tracking, see the *FortiWeb Administration Guide*:

http://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system device-tracking
  set block-duration <hours_int>
  set cleanup-historical-threat-weight-period {1-week | 3-days | 12-hours | 24-hours
      | never}
  set database-query-timeout <seconds_int>
  set delete-inactive-device-interval {days_int}
  set fingerprinting-interval <minutes_int>
end
```

Variable	Description	Default
`block-duration <hours_int>`	Enter the amount of time (in hours) that FortiWeb will block a device within a single `cleanup-historical-threat-weight-period`.	No default.

Variable	Description	Default
`cleanup-historical-threat-weight-period {1-week | 3-days | 12-hours | 24-hours | never}`	Select the amount of time that FortiWeb will store threat weight information for a device. Once threat weight information has been stored for longer than the selected amount of time, FortiWeb will remove that information.	`never`
`database-query-timeout <seconds_int>`	Enter the maximum amount of time (in seconds) that FortiWeb will wait for a response when it queries the database for threat weight information for a device. The default value is 4. The valid range is 1–30.	`3`
`delete-inactive-device-interval {days_int}`	Enter the amount of time (in days) that FortiWeb will store data for an inactive device before FortiWeb removes the data for that device. The valid range is 0–30.	`0`
`fingerprinting-interval <minutes_int>`	Enter the interval (in minutes) in which FortiWeb will update the device fingerprint of a currently tracked device. The valid range is 60–1440.	`60`

Example

This example adjusts the device tracking settings.

```
config system device-tracking
   set cleanup-historical-threat-weight-period 1-week
   set block-duration 10
   set database-query-timeout 15
   set delete-inactive-device-interval 3
   set fingerprinting-interval 70
end
```

system dns

Use this command to configure the FortiWeb appliance with its local domain name, and the IP addresses of the domain name system (DNS) servers that the FortiWeb appliance will query to resolve domain names such as www.example.com into IP addresses.

FortiWeb appliances require connectivity to DNS servers for DNS lookups. Use either the DNS servers supplied by your Internet service provider (ISP) or the IP addresses of your own DNS servers. You must provide unicast, non-local addresses for your DNS servers. Local host and broadcast addresses will not be accepted.

For improved performance, use DNS servers on your local network.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system dns
   set primary "<dns_ipv4>"
   set secondary "<dns_ipv4>"
   set domain "<local-domain_str>"
end
```

Variable	Description	Default
`primary "<dns_ipv4>"`	Enter the IP address of the primary DNS server.	`8.8.8.8`
`secondary "<dns_ipv4>"`	Enter the IP address of the secondary DNS server.	`0.0.0.0`
`domain "<local-domain_str>"`	Enter the name of the local domain to which the FortiWeb appliance belongs, if any. The maximum length is 127 characters. This field is optional. It will not appear in the `Host:` field of HTTP headers for client connections to protected web servers. **Note:** You can also configure the host name. For details, see .	No default.

Example

This example configures the FortiWeb appliance with the name of the local domain to which it belongs, example.com. It also configures its host name, `fortiweb`. Together, this configures the FortiWeb appliance with its own fully qualified domain name (FQDN), fortiweb.example.com.

```
config system global
   set hostname "fortiweb"
end
config system dns
   set domain "example.com"
end
```

Related topics

- "log syslog-policy" on page 102
- "router static" on page 110
- "system interface" on page 281

-
- "server-policy policy" on page 136

system eventhub

When FortiWeb-VM is deployed on Azure, use this command to manually configure the FortiWeb appliance to send log messages to Azure Event Hubs.

Alternatively, you can create the configuration automatically using a PowerShell script. For details, see the *FortiWeb-VM Azure Install Guide*:

https://docs.fortinet.com/fortiweb/hardware

When the event hub configuration is complete, FortiWeb sends health logs to Azure Event Hub.

If you also create a corresponding Azure CEF SIEM policy (see `config log siem-policy` (page 99)), FortiWeb also sends security logs to Azure Event Hub.

This command is available for FortiWeb-VM running on Microsoft Azure only.

You can use the Azure classic portal to obtain the values that the `config system eventhub` settings require. For detailed instructions, see the *FortiWeb-VM Azure Install Guide*:

https://docs.fortinet.com/fortiweb/hardware

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system eventhub
   set status {enable | disable}
   set appliance_id "<subscription_str>"
   set policy_saskey "<primary-key_str>"
   set policy_name "<policy-name_str>"
   set eventhub_name "<ehub-name_str>"
   set servicebus_namespace "<servicebus-namespace_str>"
end
```

Variable	Description	Default
`status {enable | disable}`	Enter `enable` to activate the Azure event hub configuration.	`disable`
`appliance_id "<subscription_str>"`	Enter the subscription (ID) that has the access to the Azure Event Hub	No default.
`policy_saskey "<primary-key_str>"`	Enter the primary shared access key that the specified policy (by `policy_name <policy-name_str>`) uses for Shared Access Signature authentication on the Azure Event	No default.

Variable	Description	Default
	Hub.	
`policy_name "<policy-name_str>"`	Enter the name of the Shared Access policy created for the Azure Event Hub.	No default.
`eventhub_name "<ehub-name_str>"`	Enter the name of the Azure Event Hub that is associated with the specified service bus (by `servicebus_namespace <servicebus-namespace_str>`).	No default.
`servicebus_namespace "<servicebus-namespace_str>"`	Enter the Service Bus Namespace that the Event Hub is created at.	No default.

Related topics

- "log siem-policy" on page 99
- "log siem-message-policy" on page 98

system fail-open

If your appliance's hardware model, network cabling, and configuration supports it, you can configure fail-to-wire/bypass behavior. This allows traffic to pass through unfiltered between 2 ports (a link pair) while the FortiWeb appliance is shut down, rebooting, or has unexpectedly lost power such as due to being accidentally unplugged or PSU failure.

Fail-open is supported **only**:

- when the operation mode is True Transparent Proxy, Transparent Inspection, or WCCP
- in standalone mode (**not** HA)
- for a bridge (V-zone) between ports wired to a CP7 processor or other hardware which provides support for fail-to-wire
  - FortiWeb 600D: port1 + port2
  - FortiWeb1000C: port3 + port4
  - FortiWeb 1000D: port3 + port4 or port5 + port6
  - FortiWeb 1000E: port3 + port4 + port5 + port6
  - FortiWeb 2000E: port1 + port2 or port3 + port4
  - FortiWeb3000C/D: port5 + port6
  - FortiWeb3000E/4000E: port9 + port10, port11 + port12, port13 + port14, or port15 + port16
  - FortiWeb 3010E: port3 + port4, port9 + port10, port11 + port12, port13 + port14 or port15 + port16
  - FortiWeb4000C/D: port5 + port6 or port7 + port8
  - FortiWeb3000CFsx/DFsx: port5 + port6 or port7 + port8

FortiWeb-400B/400C, FortiWeb HA clusters, and ports not wired to a CP7/fail-open chip do **not** support fail-to-wire.

In the case of HA, don't use fail-open—instead, use a standby HA appliance to provide full fault tolerance.

Bypass results in degraded security while FortiWeb is shut down, and therefore HA is usually a better solution: it ensures that degraded security does not occur if one of the appliances is shut down. If it is possible that **both** of your HA FortiWeb appliance could simultaneously lose power, you can add an external bypass device such as FortiBridge.

Fail-to-wire may be useful if you are required by contract to provide uninterrupted connectivity, or if you consider connectivity interruption to be a greater risk than being open to attack during the power interruption.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system fail-open
   set port3-port4 {poweroff-bypass | poweroff-cutoff}
end
```

Variable	Description	Default
`port3-port4 {poweroff-bypass | poweroff-cutoff}`	Select either: • `poweroff-bypass`—Behave like a wire when powered off, allowing connections to pass directly through from one port to the other, bypassing policy and profile filtering. • `poweroff-keep`—Interrupt connectivity when powered off. **Note:** The name of this setting varies by which ports are wired together for bypass in your specific hardware model.	`poweroff-bypass`

Related topics

- "system ha" on page 261

system fds proxy

Use this command to configure the FortiWeb proxy to override the default list of FDN servers and connect to a specific FDS IP address.

Before using this command, you must configure FortiWeb to act as a proxy server. To do so, set `fds-proxy` to `enable`. See system global for how to enable `fds-proxy`.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system fds proxy override
   set override_switch {enable | disable}
   set address "<fds_IPv4>"
end

config system fds proxy schedule
   set status {enable | disable}
   set frequency {every | daily | weekly}
   set time
   set day {Sunday | Monday | Tuesday | Wednesday | Thursday | Friday | Saturday}
end
```

Variable	Description	Default
`override_switch {enable | disable}`	Enable to override the default list of FDN servers and connect to a specific server.	`disable`
`address "<fds_IPv4>"`	Enter either an IP address or fully qualified domain name (FQDN) of the FDS override.	No default.
`status {enable | disable}`	Enable to schedule updating the database per certain frequency.	`disable`
`frequency {every | daily | weekly}`	Set the database update frequency.	No default.
`time`	Set the hour and minute ranges; hh: 0–23, mm 0–59 or 60=random.	No default.
`day {Sunday | Monday | Tuesday | Wednesday | Thursday | Friday | Saturday}`	Set the specific day during one week to update the database.	No default.

Example

This example enables configuration of the FDS proxy and configures a proxy at `192.0.2.1` with a port of `8989`.

```
config system global
   set fds-proxy enable
end

config system fds proxy
   set override_switch enable
   set address "192.0.2.1"
   set port 8989
end
```

system feature-visibility

Use this command to enable or disable the ability to view configuration options for these features in the web UI and CLI:

- Device tracking
- FTP security
- Traffic mirror

When enabled, device tracking options will be available for these commands:

- `config system device-tracking` (page 236)
- `config waf web-protection-profile inline-protection` (page 528)
- `config waf device-reputation` (page 387)

When enabled, FTP security options will be available for these commands:

- `config waf ftp-propredefined-global-white-listtection-profile` (page 1)
- `config waf ftp-command-restriction-rule` (page 401)
- `config waf ftp-file-security` (page 404)
- `config server-policy policy` (page 136)
- `config server-policy server-pool` (page 161)

By default, feature visibility for these features is disabled. While disabled, options for configuring these features are hidden in the web UI and CLI. If you're planning to configure and implement these features in your FortiWeb configuration, you'll need to enable feature visibility for them first.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system feature-visibility
   set ftp-security {enable | disable}
   set device-tracking {enable | disable}
   set traffic-mirror {enable | disable}
end
```

Variable	Description	Default
`ftp-security {enable | disable}`	Enable to display FTP security rule, profile, and policy configuration options.	`disable`
`device-tracking {enable | disable}`	Enable to display device tracking rule, profile, and policy configuration options.	`disable`
`traffic-mirror {enable | disable}`	Enable to display traffic mirror rule, profile, and policy configuration options.	`disable`

system fips-cc

Use this command to enable and configure Federal Information Processing Standards (FIPS) and Common Criteria (CC) compliant mode.

Syntax

```
config system fips-cc
   set status {enable | disable}
   set entropy-token {dynamic |  enable | disable}
   set reseed-interval <reseed-interval_int>
   set ssl-client-restrict {enable | disable}

end
```

Variable	Description	Default
`status {enable | disable}`	Enable/disable FIPS operation mode. This can be done only by the console.	`disable`
`entropy-token {dynamic |  enable | disable}`	Use the entropy token to seed the RNG in FIPS-CC mode. • When the status is enable, the entropy token is used to seed or reseed the RNG, and it must be inserted to FortiWeb. • When the status is disable, the entropy token is not used to seed or reseed the RNG, but the old method will be used to seed or reseed the RNG. • When the status is dynamic, it means when entropy token is present, the entropy token will be used to seed or reseed the RNG; if the token is not present, the old method will be used to seed or reseed the RNG.	`disable`
`reseed-interval <reseed-interval_int>`	Set the interval to reseed the RNG. The valid range is 0–1440 minutes.	`1440`
`ssl-client-restrict {enable | disable}`	Enable/disable ciphers restriction.	`disable`

system firewall address

Use this command to configure IP addresses and address ranges that FortiWeb's built-in stateful firewall uses. You use the address configuration in a firewall policy. For details, see "system firewall firewall-policy" on page 246.

Syntax

```
config system firewall address
   edit "<firewall-address_name>"
        set type {ip-netmask | ip-range}
        set ip-netmask "<firewall-address_ipv4mask>"
        set ip-address-value "<firewall-address_ipv4>"
end
```

Variable	Description	Default
"<firewall-address_name>"	Enter a name that identifies this firewall address configuration.	No default.
type {ip-netmask | ip-range}	Select how this configuration specifies a firewall address or addresses: • ip-netmask—A single IP address and netmask. • ip-range—A single IP address or a range of IP addresses.	ip-range
ip-netmask "<firewall-address_ipv4mask>"	Enter an IPv4 address and subnet mask, separated by a forward slash (/). For example, 192.0.2.2/24. Available when type {ip-netmask | ip-range} (page 245) is ip-netmask.	No default.
ip-address-value "<firewall-address_ipv4>"	Enter a single IP address or a range of addresses. For example, 192.0.2.1, or 192.0.2.1-192.0.2.255. Available when type {ip-netmask | ip-range} (page 245) is ip-range.	No default.

system firewall service

Use this command to configure the protocols and ports that FortiWeb's built-in stateful firewall uses. You use the service configuration in a firewall policy. For details, see "system firewall firewall-policy" on page 246.

Syntax

```
config system firewall service
   edit "<firewall-service_name>"
        set protocol {TCP | UDP | ICMP}
        set source-port-min <source-port-min_int>
        set source-port-max <source-port-max_int>
        set destination-port-min <source-port-min_int>
        set destination-port-max <source-port-max_int>
end
```

Variable	Description	Default
"<firewall-service_name>"	Enter a name that identifies this firewall service configuration.	No default.
protocol {TCP | UDP | ICMP}	Select the protocol for this firewall service configuration.	TCP
source-port-min <source-port-min_int>	Enter the start port in the range of source ports for this firewall service.	0
source-port-max <source-port-max_int>	Enter the end port in the range of source ports for this firewall service	65535
destination-port-min <source-port-min_int>	Enter the start port in the range of destination ports for this firewall service.	0
destination-port-max <source-port-max_int>	Enter the end port in the range of destination ports for this firewall service	65535

Related topics

- "system firewall firewall-policy" on page 246

system firewall firewall-policy

Use this command to configure the policies that FortiWeb's built-in stateful firewall uses to determine which traffic to allow and deny.

The firewall policy uses address and service configurations that you create separately. For details, see "system firewall address" on page 245 and "system firewall service" on page 245.

Syntax

```
config system firewall firewall-policy
   set default-action {deny | accept}
```

```
config firewall-policy-match-list
   edit <entry_index>
      set in-interface "<incoming_interface_name>"
      set out-interface "<outgoing_interface_name>"
      set src-address "<firewall-address_name>"
      set dest-address "<firewall-address_name>"
      set service "<firewall-service_name>"
      set action {deny | accept}
      set vzone-enable {enable | disable}
      set vzone "<vzone_name>"

end
```

Variable	Description	Default
`default-action {deny | accept}`	Select either: • `deny`—Firewall blocks traffic that does not match a policy rule. However, administrative access is still allowed on network interfaces for which it has been configured. • `accept`—Firewall allows traffic that does not match a policy rule.	`accept`
`<entry_index>`	Enter the index number of the policy rule in the table.	No default.
`in-interface "<incoming_interface_name>"`	Enter the name of the interface (for example, `port1`) on which FortiWeb receives packets it applies this firewall policy rule to.	No default.
`out-interface "<outgoing_interface_name>"`	Enter the name of the interface (for example, `port2`) through which FortiWeb routes packets it applies this firewall policy rule to.	No default.
`src-address "<firewall-address_name>"`	Enter the name of the firewall address configuration that specifies the source IP address or addresses to which this policy applies. For details about creating firewall address configurations, see "system firewall address" on page 245.	No default.
`dest-address "<firewall-address_name>"`	Enter the name of the firewall address configuration that specifies the source IP address or addresses to which this policy rule applies. For details about creating firewall address configurations, see "system firewall address" on page 245.	No default.
`service "<firewall-service_name>"`	Enter the name of the firewall service configuration that specifies the protocols and ports to which this policy rule applies.	No default.

Variable	Description	Default
	For details about creating firewall address configurations, see "system firewall address" on page 245.	
`action {deny | accept}`	Enter either: • `deny`—Firewall blocks traffic that matches this policy rule. However, administrative access is still allowed on network interfaces for which it has been configured. • `accept`—Firewall allows traffic that matches this policy rule.	`deny`
`vzone-enable {enable | disable}`	Select to enable a V-zone (bridge). If this option is enabled, select a V-zone to use. V-zones allow network connections to travel through FortiWeb's physical network ports without explicitly connecting to one of its IP addresses. This option is available only when the operation mode is True Transparent Proxy or Transparent Inspection mode.	`disable`
`vzone "<vzone_name>"`	Select a configured V-zone. For details about creating a V-zone, see "system v-zone" on page 313.	No default.

Example

This example configures a firewall policy to deny any HTTP services but coming from specified sources.

```
config system firewall address
   edit "alloowed_source"
      set type ip-range
      set ip-address-value "172.22.203.100-172.22.203.115"
end
config system firewall address
   edit "site1"
      set type ip-netmask
      set ip-netmask "206.11.0.2/24"
end
config system firewall service
   edit "http"
      set protocol TCP
      set destination-port-min 80
      set destination-port-max 80
end
config system firewall firewall-policy
   set default-action deny
   config firewall-policy-match-list
      edit 1
         set in-interface port1
         set out-interface port2
         set src-address site1
         set dest-address site1
         set service http
         set action accept
      next
```

```
    end
  end
```

Related topics

- "system firewall service" on page 245

system firewall snat-policy

Use this command to configure a firewall SNAT policy. Firewall SNAT policies translate a matching source IP address to a single IP address or an IP address in an address pool.

Firewall SNAT policies are available in Reverse Proxy, True Transparent Proxy, and Transparent Inspection operating modes.

FortiWeb applies a firewall SNAT policy only if IP forwarding is enabled. For details about IP forwarding, see "router setting" on page 108.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system firewall snat-policy
  edit policy_name
    set from "<source_ipv4_mask>"
    set out-interface "<egress_port>"
    set to "<destination_ipv4_mask>"
    set trans-to-ip "<translation_ipv4>"
    set trans-to-ip-end "<last_ipv4>"
    set trans-to-ip-start "<first_ipv4>"
    set trans-to-type {ip | pool}
```

Variable	Description	Default
`policy_name`	Enter a name that identifies the firewall SNAT policy. Don't use spaces or special characters. The maximum length is 63 characters.	No default.
`from "<source_ipv4_mask>"`	Enter the IP address and subnet mask to match the source IP address in the packet header that you want to translate. An example `from` is `192.0.2.0/24`. The IP address must be an IPv4 address.	`0.0.0.0/0`
`out-interface "<egress_port>"`	Select the interface that FortiWeb will use to forward traffic that matches the `from "<source_ipv4_mask>"`	No default.

Variable	Description	Default
	(page 249).	
`to "<destination_ipv4_mask>"`	Enter the IP address and subnet mask to match the destination IP address in the packet header. An example **Destination** is `192.0.2.1/24`. The IP address must be an IPv4 address.	`0.0.0.0/0`
`trans-to-ip "<translation_ipv4>"`	Enter the IP address that you want to translate the `from "<source_ipv4_mask>"` (page 249) to. An example IP address is `192.0.2.2`. The IP address must be an IPv4 address. This option is available only when the `trans-to-type {ip | pool}` (page 250) is set to `IP Address`.	`0.0.0.0`
`trans-to-ip-end "<last_ipv4>"`	Enter the last IP address in the SNAT pool. An example IP address is `192.0.2.4`. The IP address must be an IPv4 address. This option is available only when the `trans-to-type {ip | pool}` (page 250) is set to `pool`.	`0.0.0.0`
`trans-to-ip-start "<first_ipv4>"`	Enter the first IP address in the SNAT pool. An example IP address is `192.0.2.3`. The IP address must be an IPv4 address. This option is available only when the `trans-to-type {ip | pool}` (page 250) is set to `pool`.	`0.0.0.0`
`trans-to-type {ip | pool}`	Select one of the following: • `ip`—Select to translate the `from "<source_ipv4_mask>"` (page 249) to an IP address that you specify. To specify an IP address, configure `trans-to-ip "<translation_ipv4>"` (page 250). • `pool`—Select to translate the `from "<source_ipv4_mask>"` (page 249) to the next available IP address in an IP address pool that you specify. To specify an IP address pool, configure both `trans-to-ip-start "<first_ipv4>"` (page 250) and `to "<destination_ipv4_mask>"` (page 250).	`ip`

system fortigate-integration

FortiGate appliances can maintain a list of source IPs that it prevents from interacting with the network and protected systems. You can configure FortiWeb to receive this list of IP addresses at intervals you specify. Then, you configure an inline protection profile to detect the IP addresses in the list and take an appropriate action.

This feature is available only if the operating mode is Reverse Proxy or True Transparent Proxy.

This command configures a FortiGate appliance that provides banned source IPs. To configure FortiWeb to detect the quarantined IP addresses and take the appropriate action, configure the FortiGate Quarantined IPs settings in an inline protection profile. For details, see "waf web-protection-profile inline-protection" on page 528.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system fortigate-integration
  set address "<address_ipv4>"
  set port <port_int>
  set protocol {HTTP | HTTPS}
  set username "<username_str>"
  set password "<password_str>"
  set schedule-frequency <schedule-frequency_int>
  set flag {enable | disable}
end
```

Variable	Description	Default
`address "<address_ipv4>"`	Enter the FortiGate IP address that is used for administrative access.	No default.
`port <port_int>`	Specify the port that the FortiGate uses for administrative access via HTTPs. In most cases, this is port 443.	`80`
`protocol {HTTP | HTTPS}`	Specify whether the FortiGate and FortiWeb communicate securely using HTTPS.	`HTTP`
`username "<username_str>"`	Enter the name of the administrator account that FortiWeb uses to connect to the FortiGate.	No default.
`password "<password_str>"`	Enter the password for the FortiGate administrator account that FortiWeb uses.	No default.
`schedule-frequency <schedule-frequency_int>`	Enter how often FortiWeb checks the FortiGate for an updated list of banned source IP addresses, in hours. The valid range is 1 to 5.	`1`

Variable	Description	Default
`flag {enable | disable}`	Enables or disables the transmission of quarantined source IP address information from the specified FortiGate.	`disable`

Related topics

- "waf file-upload-restriction-policy" on page 395
- "log reports" on page 87
- "system fortisandbox-statistics" on page 673

system fortisandbox

Use this command to configure FortiWeb to submit all files that match your upload restriction rules to FortiSandbox.

FortiSandbox evaluates whether the file poses a threat and returns the result to FortiWeb. If FortiSandbox determines that the file is malicious, FortiWeb performs the following tasks:

- Generates an attack log message that contains the result.
- For 10 minutes after it receives the FortiSandbox results, takes the action specified by the file security policy. During this time, it does not re-submit the file to FortiSandbox.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system fortisandbox
   set type {fsa | cloud}
   set server "<server_ipv4>"
   set cache-timeout <timeout_int>
   set email "<email_str>"
   set interval <interval_int>
   set elog {enable | disable}
end
```

Variable	Description	Default
`type {fsa | cloud}`	Specify whether FortiWeb submits files that match the upload restriction rules to a FortiSandbox physical appliance (or FortiSandbox-VM) or to FortiSandbox Cloud. The FortiSandbox Cloud option requires you to register your FortiWeb and a FortiWeb FortiGuard Sandbox Cloud Service subscription.	`fsa`
`server "<server_ipv4>"`	Enter the IP address of the FortiSandbox to send files to. Available only when `type` is `fsa`.	No default.

Variable	Description	Default
`cache-timeout <timeout_int>`	Enter how long FortiWeb waits before it clears the hash table entry for an uploaded file that was evaluated by FortiSandbox, in hours. The valid range is 1–168. FortiWeb stores file evaluation results from FortiSandbox in a hash table. Whenever a client uploads a file, FortiWeb looks for a table entry that matches it. If there is a matching entry, FortiWeb takes action based on the stored result. If there is no matching entry, FortiWeb sends the file to FortiSandbox for evaluation.	`72`
`email "<email_str>"`	Enter the email address that FortiSandbox sends weekly reports and notifications to.	No default.
`interval <interval_int>`	Enter a number that specifies how often FortiWeb retrieves statistics from FortiSandbox, in minutes.	`5`
`elog {enable | disable}`	Enter so that FortiWeb will report event logs when it successfully submits files to FortiSandbox.	`disable`

Example

This example creates a connection to a FortiSandbox at `192.0.2.2` that retrieves statistics at the default interval (5 minutes) and sends a weekly report to admin@example.com.

```
config system fortisandbox
  set server "192.0.2.2"
  set ssl enable
  set email "admin@example.com"
end
```

Related topics

- "system fortisandbox-statistics" on page 673

system global

Use this command to configure system-wide settings such as language, display refresh rate and listening ports of the web UI, the time zone and host name of the FortiWeb appliance, and NTP time synchronization.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system global
   set admin-port <port_int>
   set admin-sport <port_int>
   set admin-lockout-threshold <admin-lockout-threshold_int>
   set admin-lockout-duration <minutes_int>
   set admintimeout <minutes_int>
   set adom-admin {enable | disable}
   set auth-timeout <milliseconds_int>
   set cli-signature {enable | disable}
   set confsync-port <port_int>
   set dh-params {1024 | 1536 | 2048 | 3072 | 4096 | 6144 | 8192}
   set dst {enable | disable}
   set fds-proxy {enable | disable}
   set force-us-only {enable | disable}
   set hostname "<host_name>"
   set admin-https-pki-required {enable | disable}
   set https-certificate "<certificate_name>"
   set ie6workaround {enable | disable}
   set language {english |japanese | simch | trach}
   set ntpserver {"<ntp_fqdn>" | "<ntp_ipv4>"}
   set ntpsync {enable | disable}
   set pre-login-banner {enable | disable}
   set record-cli-fail-cmd {enable | disable}
   set refresh <seconds_int>
   set syncinterval <minutes_int>
   set timezone "<time-zone-code_str>"
   set tftp {enable | disable}
   set ssh-fips {enable | disable}
end
```

Variable	Description	Default
admin-port <port_int>	Enter the port number on which the FortiWeb appliance listens for HTTP access to the web UI. The valid range is 1–65,535.	80
admin-sport <port_int>	Enter the port number on which the FortiWeb appliance listens for HTTPS (SSL-secured) access to the web UI. The valid range is 1–65,535.	443
admin-lockout-threshold <admin-lockout-threshold_int>	Enter the number of invalid logon attempts before the account is locked out. The valid range is 1–10.	3
admin-lockout-duration <minutes_int>	Set the length of time the account remains locked. The valid range is 1–2147483647 seconds.	60
admintimeout <minutes_int>	Enter the amount of time (in minutes)	5

Variable	Description	Default
	after which an idle administrative session with the web UI or CLI will be automatically logged out. The valid range is 1–48. To improve security, do not increase the idle timeout.	
`adom-admin {enable | disable}`	Enable to be able to restrict administrator accounts to specific administrative domains. See also `domains "<adom_name>"` (page 195). **Note:** After you type `end`, if this setting is enabled, the CLI will terminate your session and restructure the configuration to use ADOMs. Global settings will remain in the global configuration scope, but objects that are configurable separately per ADOM such as services are moved to the `root` ADOM. To continue by configuring additional ADOMs, log in again, then go to "Defining ADOMs" on page 66.	`disable`
`auth-timeout <milliseconds_int>`	Enter the number of milliseconds that FortiWeb will wait for the remote authentication server to respond to its query. The valid range is 1–60,000. If administrator logins often time out, and FortiWeb is configured to query an external RADIUS or LDAP server, increasing this value may help. This setting only affects remote authentication queries for **administrator** accounts. To configure the query connection timeout for end-user accounts, use `auth-timeout <timeout_int>` (page 415) instead.	`2000`
`cli-signature {enable | disable}`	Enable to be able to enter custom attack signatures via the CLI. Typically, attack signatures should be entered using the web UI, where you can verify syntax and test matching of	`disable`

Variable	Description	Default
	your regular expression. If you are sure that your expression is correct, you can enable this option to enter your custom signature via the CLI.	
`confsync-port <port_int>`	Enter the port number the local FortiWeb uses to listen for a remote (peer) FortiWeb. Used when you have configured FortiWeb to synchronize its configuration. The valid range is 1–65,535. **Caution:** The port number must be different than the port number set using `config server-policy custom-application application-policy` (page 1).	`8333`
`dh-params {1024 | 1536 | 2048 | 3072 | 4096 | 6144 | 8192}`	Specifies the key length that FortiWeb presents in Diffie-Hellman exchanges. Most web browsers require a key length of at least 2048.	`2048`
`dst {enable | disable}`	Enable to automatically adjust the FortiWeb appliance's clock for daylight savings time (DST).	`disable`
`fds-proxy {enable | disable}`	Enable to configure FortiWeb to act as a proxy for the FDN. For details, see "system fds proxy" on page 241.	`disable`
`force-us-only {enable | disable}`	Enable so that FortiWeb will receive FortiGuard service updates from FortiGuard servers located only in the United States.	`disable`
`hostname "<host_name>"`	Enter the host name of this FortiWeb appliance. Host names may include US-ASCII letters, numbers, hyphens, and underscores. The maximum length is 63 characters. Spaces and special characters are not allowed. The host name of the FortiWeb appliance is used in several places.	`FortiWeb`

Variable	Description	Default
	• It appears in the **System Information** widget on the **Status** tab of the web UI, and in the `config router all` (page 1) CLI command. • It is used in the command prompt of the CLI. • It is used as the SNMP system name. For details about SNMP, see "system snmp sysinfo" on page 306. The **System Information** widget and the `config router all` (page 1) CLI command will display the full host name. However, if the host name is longer than 16 characters, the CLI and other places display the host name in a truncated form ending with a tilde (~) to indicate that additional characters exist, but are not displayed. For example, if the host name is FortiWeb1234567890, the CLI prompt would be `FortiWeb123456789~#`. **Note:** You can also configure the local domain name. For details, see "system dns" on page 237.	
`admin-https-pki-required {enable | disable}`	Enable to use certificate-based Web UI login. Before enabling this, please make sure the related configurations are set correctly. For details, see "system admin-certificate ca" on page 199, "user pki-user" on page 326, and "user admin-usergrp" on page 318.	`disable`
`https-certificate "<certificate_name>"`	Specifies the certificate that FortiWeb uses for the accesses to its Web UI through HTTPS. This must be one of the certificates stored locally on the FortiWeb for administration. For details, see "system admin-certificate local" on page 199.	`defaultcert`
`ie6workaround {enable | disable}`	Enable to use the work around for a navigation bar freeze issue caused by using the web UI with Microsoft Internet Explorer 6.	`disable`

Variable	Description	Default
`language {english |japanese | simch | trach}`	Select which language to use when displaying the web UI. The display's web pages will use UTF-8 encoding, regardless of which language you choose. UTF-8 supports multiple languages, and allows all of them to be displayed correctly, even when multiple languages are used on the same web page. For example, your organization could have websites in both English and simplified Chinese. Your FortiWeb administrators prefer to work in the English version of the web UI. They could use the web UI in English while writing rules to match content in both English and simplified Chinese **without** changing this setting. Both the rules and the web UI will display correctly, as long as all rules were input using UTF-8. Usually, your text input method or your management computer's operating system should match the display, and also use UTF-8. If they do not, you may not be able to correctly display both your input and the web UI at the same time. For example, your web browser's or operating system's default encoding for simplified Chinese input may be GB2312. However, you **usually** should switch it to be UTF-8 when using the web UI, **unless** you are writing regular expressions that must match HTTP client's requests, and those requests use GB2312 encoding. For more information on language support in the web UI and CLI, see "Language support & regular expressions" on page 60. **Note:** This setting does **not** affect the display of the CLI.	`english`

Variable	Description	Default
`ntpserver {"<ntp_fqdn>" | "<ntp_ipv4>"}`	Enter the IP address or fully qualified domain name (FQDN) of a Network Time Protocol (NTP) server or pool, such as `pool.ntp.org`, to query in order to synchronize the FortiWeb appliance's clock. The maximum length is 63 characters. For details about NTP and to find the IP address of an NTP server that you can use, go to: http://www.ntp.org/	`pool.ntp.org`
`ntpsync {enable | disable}`	Enable to automatically update the system date and time by connecting to a NTP server. Also configure ntpserver {"<ntp_fqdn>" | "<ntp_ipv4>"}, syncinterval <minutes_int> and timezone "<time-zone-code_str>".	`enable`
`pre-login-banner {enable | disable}`	Enable to add a login disclaimer message for administrators logging in to FortiWeb. This disclaimer is a statement that a user accepts or declines. It is useful for environments such as corporations that are governed by strict usage policies for forensics and legal reasons. For details about modifying the disclaimer, see "system replacemsg" on page 296.	`disable`
`record-cli-fail-cmd {enable | disable}`	Enable so that FortiWeb will generate an event log if a CLI command fails or is executed incorrectly.	`disable`
`refresh <seconds_int>`	Enter the automatic refresh interval (in seconds) for the web UI's **System Status Monitor** widget. The valid range is 0–9,223,372,036,854,775,807. To disable automatic refreshes, type `0`.	`80`
`syncinterval <minutes_int>`	Enter how often (in minutes) the FortiWeb appliance should synchronize its time with the Network Time Protocol (NTP) server. The valid range is 1–1440. To disable	`60`

Variable	Description	Default
	time synchronization, type `0`.	
`tftp {enable | disable}`	Specify whether FortiWeb can perform backups, restoration, firmware updates and other tasks using TFTP.	`enable`
`timezone "<time-zone-code_str>"`	Enter the two-digit code for the time zone in which the FortiWeb appliance is located. The valid range is from `00` to `75`. To display a list of time zone codes, their associated the GMT time zone offset, and contained major cities, type `set timezone ?`.	`04`
`ssh-fips {enable | disable}`	A setting used with Federal Information Processing Standards (FIPS) and Common Criteria (CC) compliant mode. When the FIPS-CC certification process is complete, a separate document will provide detailed information about this command.	`disable`

Example

This example configures time synchronization with a public NTP server pool. The FortiWeb appliance is located in the Pacific Time zone (code `04`) and will synchronize its time with the NTP server pool every 60 minutes.

```
config system global
  set timezone 08
  set ntpsync enable
  set ntpserver "pool.ntp.org"
  set syncinterval 30
end
```

For an example that includes a hostname, see "system dns" on page 237.

system ha

Use this command to configure the FortiWeb appliance to act as a member of a high availability (HA) cluster in order to improve availability.

By default, FortiWeb appliances are each a single, standalone appliance and operate independently.

If you have purchased more than one FortiWeb appliance, you can configure them to form an **active-passive** or **active-active** high availability (HA) FortiWeb cluster. This improves availability so that you can achieve your service level agreement (SLA) uptimes even if hardware failures occur or maintenance periods are required.

If you have multiple FortiWeb appliances but do **not** need failover, you can still synchronize the configuration. This can be useful for cloned network environments and externally load-balanced active-active HA. For details, see "server-policy custom-application application-policy" on page 1.

HA requirements

- Two (for active-passive mode and active-active mode) or more (for active-active mode) identical physical FortiWeb appliances and firmware versions
- Redundant network topology: if the active appliance fails, physical network cabling and routes must redirect web traffic to the standby appliance
- At least one physical port on both HA appliances connected directly, via crossover cables, or through switches

FortiWeb-VM now supports HA. However, if you do not wish to use the native HA, you can use your hypervisor or VM environment manager to install your virtual appliances over a hardware cluster to improve availability. For example, VMware clusters can use vMotion or VMware HA.

If FortiWeb HA is **active-passive**: one appliance is selected to be the active appliance (also called the primary, main, or master), applying the policies for all connections. The other is a passive standby (also called the secondary, standby, or slave), which assumes the role of the active appliance and begins processing connections **only** if the active appliance fails.

If FortiWeb HA is **active-active**: all the cluster members are operating as active appliances together to simultaneously handle the traffic between clients and the back web servers. In an active-active HA cluster, one of the member appliances will be selected as the master appliance to centrally receive traffic from clients and back web servers to distribute the traffic to all the cluster members (including itself) according to the specified **load balancing algorithm**. An active-active HA cluster requires **heartbeat detection** and **configuration and session synchronization** between the cluster members. If the master appliance fails, one of the slaves will take it over. An active-active HA cluster can be created only in **Reverse Proxy** and **True Transparent Proxy** mode, and at most **eight** FortiWeb appliances are allowed in the cluster.

For more information on HA, including troubleshooting, failover behavior, synchronized data, and network topology, see the FortiWeb Administration Guide:

https://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system ha
   set mode {active-passive | active-active | standalone}
   set group-id <group_int>
   set group-name "<pair-name_str>"
   set priority <level_int>
   set override {enable | disable}
   set network-type {flat | udp-tunnel}
   set tunnel-local "<class_ip>"
   set tunnel-peer "<class_ip>"
   set hbdev "<interface_name>"
   set hbdev-backup "<interface_name>"
   set lacp-ha-slave {enable | disable}
   set link-failed-signal {enable | disable}
   set hb-interval <milliseconds_int>
   set hb-lost-threshold <seconds_int>
   set arps <arp_int>
   set arp-interval <seconds_int>
   set monitor {"<interface_name>" ...}
   set boot-time <limit_int>
   set ha-mgmt-status {enable | disable}
   set ha-mgmt-interface "<interface_name>"
   set schedule {ip | leastconnection | round-robin}le {ip | leastconnection | round-
       robin}
   set session-sysession-sync-broadcast {enable | disable}nc-broadcast {enable | disable}
   set session-sync-dev {"<interface_name>" ...}
   set session-warm-up <seconds_int>
   set weight-1 <weight_int>
   set weight-2 <weight_int>
   set weight-3 <weight_int>

   set eip-addr <class_ip>
   set eip-aid <eip-aid_str>
   set ha-eth-type <ha-eth-type_str>
   set hc-eth-type <hc-eth-type_str>
   set hbcast-eth-type <hbcast-eth-type_str>
   set l2ep-eth-type <l2ep-eth-type_str>
   set 17-persistence-sync {enable | disable}
   set server-policy-hlck {enable | disable}
end
```

Variable	Description	Default
`mode {active-passive |`	Select one of the following:	`standalone`

Variable	Description	Default
`active-active | standalone}`	• `active-passive`—Form an HA group with another FortiWeb appliance. The appliances operate together, with the standby assuming the role of the active appliance if it fails. • `active-active`—Form an HA group with other FortiWeb appliances. All the appliances are active simultaneously to handle the receiving traffic together. • `standalone`—Operate each appliance independently. **Note:** To avoid connectivity issues, do not use config system ha to remove an appliance from an HA cluster. Instead, use `config ha disconnect` (page 649), which removes the appliance from the cluster and changes the HA mode to standalone.	
`group-id <group_int>`	Enter a number that identifies the HA pair. **Both members of the HA pair must have the same group ID.** If you have more than one HA pair on the same network, each HA pair must have a different group ID. Changing the group ID changes the cluster's virtual MAC address. The valid range is 0 to 63.	`0`
`group-name "<pair-name_str>"`	Enter a name to identify the HA pair if you have more than one. This setting is optional, and does not affect HA function. The maximum length is 63 characters.	No default.
`priority <level_int>`	Enter the priority of the appliance when electing the primary appliance in the HA pair. On standby devices, this setting can be reconfigured using the CLI command `config ha manage` (page 651). This setting is optional. The smaller the number, the higher the priority. The valid range is 0 to 9. **Note:** By default, unless you enable `override {enable | disable}` (page 263), uptime is more important than this setting.	`5`
`override {enable | disable}`	Enable to make `priority <level_int>` (page 263) a more important factor than uptime when selecting the primary appliance.	`disable`

Variable	Description	Default
`network-type {flat | udp-tunnel}`	Select the common HA mode flat or udp-tunnel mode on OpenStack platform.	`flat`
`tunnel-local "<class_ip>"`	Set the local IP address on OpenStack platform. This filed can be configured only when the network type is upd-tunnel.	No default.
`tunnel-peer "<class_ip>"`	Set the peer IP address on OpenStack platform. This filed can be configured only when the network type is upd-tunnel.	No default.
`hbdev "<interface_name>"`	Select which port on this appliance that the main and standby appliances will use to send heartbeat signals and synchronization data between each other (i.e. the HA heartbeat link). The maximum length is 15 characters. Connect this port to the same port number on the other member of the HA cluster. (e.g., If you select `port3` for the primary heartbeat link, connect port3 on **this** appliance to port3 on the **other** appliance.) At least one heartbeat interface must be selected on each appliance in the HA cluster. Ports that currently have an IP address assigned for other purposes (that is, virtual servers or bridges) cannot be re-used as a heartbeat link. At least one heartbeat interface must be selected on each appliance in the HA cluster. Ports that currently have an IP address assigned for other purposes (that is, virtual servers or bridges) cannot be re-used as a heartbeat link. **Tip:** If enough ports are available, you can select both a primary heartbeat interface and a secondary heartbeat interface (`hbdev-backup "<interface_name>"` (page 264)) on each appliance in the HA pair to provide heartbeat link redundancy. You cannot use the same port as both the primary and secondary heartbeat interface on the same appliance, as this is incompatible with the purpose of link redundancy. **Note:** If a switch is used to connect the heartbeat interfaces, the heartbeat interfaces must be reachable by Layer 2 multicast.	No default.
`hbdev-backup "<interface_name>"`	Select a secondary, standby port on this appliance that the main and standby appliances will use to send heartbeat signals and synchronization data between	No default.

Variable	Description	Default
	each other (i.e. the HA heartbeat link). It must **not** be the same network interface as `hbdev "<interface_name>"` (page 264). The maximum length is 15 characters. Connect this port to the same port number on the other member of the HA cluster. (e.g., If you select `port4` for the secondary heartbeat link, connect port4 on **this** appliance to port4 on the **other** appliance.) Ports that currently have an IP address assigned for other purposes (that is, virtual servers or bridges) cannot be re-used as a heartbeat link.	
`lacp-ha-slave {enable | disable}`	Enable to provide support for 2 LACP interfaces, also known as "bridges," "V-zones," or "aggregated links." For more information about configuring bridges, see the *FortiWeb Administration Guide*: http://docs.fortinet.com/fortiweb/admin-guides	`disable`
`link-failed-signal {enable | disable}`	Enable to ensure that all equipment in the network detects the new primary unit in a cluster after a failover occurs. When a failover occurs in an HA active-passive cluster, the new primary unit broadcasts gratuitous ARP packets so that switches will refresh their MAC forwarding tables and detect the new primary unit. However, sometimes switches will not immediately detect a failover and refresh MAC forwarding tables to recognize a new primary unit. This command shuts down each interface (except for the heartbeat interfaces and reserve management interfaces) of the former primary unit for about a second so that any remaining equipment that did not automatically detect the failover will refresh their MAC forwarding tables and recognize the new primary unit,	`disable`
`arps <arp_int>`	Enter the number of times that the FortiWeb appliance will broadcast address resolution protocol (ARP) packets (IPv4 environment) or Neighbor Solicitation (NS) packets (IPv6 environment) when it takes on the main role. Even though a new NIC has not actually been connected to the network, FortiWeb does this to notify the network that a different physical port has become associated with the IP address and virtual MAC of the	`3`

Variable	Description	Default
	HA pair. This is sometimes called “using gratuitous ARP packets to train the network,” and can occur when the main appliance is starting up, or during a failover. Also configure `arp-interval <seconds_int>` (page 266). Normally, you do not need to change this setting. Exceptions include: • Increase the number of times the main appliance sends gratuitous ARP packets if your HA pair takes a long time to fail over or to train the network. Sending more gratuitous ARP packets may help the failover to happen faster. • Decrease the number of times the main appliance sends gratuitous ARP packets if your HA pair has a large number of VLAN interfaces and virtual domains. Because gratuitous ARP packets are broadcast, sending them may generate a large amount of network traffic. As long as the HA pair still fails over successfully, you could reduce the number of times gratuitous ARP packets are sent to reduce the amount of traffic produced by a failover. The valid range is 1–16.	
`arp-interval <seconds_int>`	Enter the number of seconds to wait between each broadcast of ARP/NS packets. Normally, you do not need to change this setting. Exceptions include: • Decrease the interval if your HA pair takes a long time to fail over or to train the network. Sending ARP packets more frequently may help the failover to happen faster. • Increase the interval if your HA pair has a large number of VLAN interfaces and virtual domains. Because gratuitous ARP packets are broadcast, sending them may generate a large amount of network traffic. As long as the HA pair still fails over successfully, you could increase the interval between when gratuitous ARP packets are sent to reduce the rate of traffic produced by a failover. The valid range is 1–20.	`1`
`hb-interval <milliseconds_int>`	Enter the number of 100-millisecond intervals to set the pause between each heartbeat packet that the one FortiWeb appliance sends to the other FortiWeb appliance in the HA pair. This is also the amount of time that a FortiWeb appliance waits before expecting to	`1`

Variable	Description	Default
	receive a heartbeat packet from the other appliance. This part of the configuration is synchronized between the active appliance and standby appliance. The valid range is 1–20 (that is, between 100 and 2,000 milliseconds). **Note:** Although this setting is synchronized between the main and standby appliances, you should initially configure both appliances with the same `hb-interval <milliseconds_int>` (page 266) to prevent inadvertent failover from occurring before the initial synchronization.	
`hb-lost-threshold <seconds_int>`	Enter the number of times one of HA appliances retries the heartbeat and waits to receive HA heartbeat packets from the other HA appliance before assuming that the other appliance has failed. This part of the configuration is synchronized between the main appliance and standby appliance. Normally, you do not need to change this setting. Exceptions include: • Increase the failure detection threshold if a failure is detected when none has actually occurred. For example, during peak traffic times, if the main appliance is very busy, it might not respond to heartbeat packets in time, and the standby appliance may assume that the main appliance has failed. • Reduce the failure detection threshold or detection interval if administrators and HTTP clients have to wait too long before being able to connect through the main appliance, resulting in noticeable down time. The valid range is 1–60. **Note:** Although this setting is synchronized between the main and standby appliances, you should initially configure both appliances with the same `hb-lost-threshold <seconds_int>` (page 267) to prevent inadvertent failover from occurring before the initial synchronization. **Note:** You can use SNMP traps to notify you when a failover is occurring. For details, see "system snmp community" on page 301.	`3`
`monitor {"<interface_`	Enter the name of one or more network interfaces that	No default.

Variable	Description	Default
`name>" ...}`	each directly correlate with a physical link. These ports will be monitored for link failure. Separate the name of each network interface with a space. To remove from or add to the list of monitored network interfaces, retype the entire list. Port monitoring (also called interface monitoring) monitors physical network ports to verify that they are functioning properly and linked to their networks. If the physical port fails or the cable becomes disconnected, a failover occurs. You can monitor physical interfaces, but **not** VLAN subinterfaces or 4-port switches. **Note:** To prevent an unintentional failover, do not configure port monitoring **until** you configure HA on both appliances in the HA pair, and have plugged in the cables to link the physical network ports that will be monitored.	
`boot-time <limit_int>`	Enter the maximum number of seconds that a appliance will wait for a heartbeat or synchronization connection after the appliance returns online. If this limit is exceeded, the appliance will assume that the other unit is unresponsive, and assume the role of the main appliance. Due to the default heartbeat and synchronization intervals, as long as the HA pair are cabled directly together, the default value is usually sufficient. If the HA heartbeat link passes through other devices, such as routers and switches, however, a larger value may be needed. You may notice this especially when updating the firmware. The valid range is 1–100 seconds.	`30`
`ha-mgmt-status {enable | disable}`	Specifies whether the network interface you select provides administrative access to this appliance when it is a member of the HA cluster. When this option is selected, you can access the configuration for this cluster member using the IP address of the specified network interface. The interface configuration, including administrative access and other settings, is not synchronized with other cluster members. You can configure up to eight reserve management	`disable`

Variable	Description	Default
	ports in each HA cluster. You cannot configure routing for the port you select.	
`ha-mgmt-interface "<interface_name>"`	Specifies the network interface that provides administrative access to this appliance when it is a member of the HA cluster.	No default.
`schedule {ip | leastconnection | round-robin}`	Specifies the load-balancing algorithm used by the master appliance (in an active-active HA cluster) to distribute received traffic over the available cluster members. • `ip`—Consistently distribute the traffic coming from a source to the same cluster member. • `leastconnection`—Dynamically distribute traffic to a cluster member who has the fewest connections processing. • `round-robin`—Distribute traffic among the available members in a circular order. Note that FortiWeb's Session Management is not supposed by the active-active HA deployment with the algorithm By connections or Round-robin being used for the load-balancing. Available only when `mode {active-passive | active-active | standalone}` (page 262) is `active-active`.	`ip`
`session-sync-broadcast {enable | disable}`	Specifies whether the master appliance in an active-active HA cluster synchronizes sessions to others in broadcast. By default, session information is synchronized in unicast. Broadcast will be recommended if a active-active HA cluster contains many appliances. Available only when `mode {active-passive | active-active | standalone}` (page 262) is `active-active`.	`disable`
`session-sync-dev {"<interface_name>" ...}`	The master appliance use the heartbeat interface (`hbdev "<interface_name>"` (page 264)) to synchronize its session table to other appliances in an active-active HA cluster by default. However, you can use extra interfaces (up to four interfaces) for the session synchronization when the HA cluster is in heavy traffic. Specifies the network interface(s) of this FortiWeb	No default.

Variable	Description	Default
	appliance for session synchronizations. For example, typing `set session-sync-dev port3 port4 port5` for using port3, port4 and port5 to synchronize session information. **Note:** • Only the master appliance in the active-active HA cluster is allowed to set `session-sync-dev`. The configuration here will be synchronized to all the slave appliance in the cluster by the master, and all the appliances send or receive session information with the same interface configuration. • The heartbeat interface will not participate in the session synchronization anymore if other interfaces are specified here. • It can not specify the heartbeat interface to `session-sync-dev`. • Available only when `mode {active-passive | active-active | standalone}` (page 262) is `active-active`.	
`session-warm-up <seconds_int>`	Specifies the active-active HA warm-up time that the master appliance will hold traffic distribution to wait for the active-active HA negotiation (determine the master and slave, and necessary synchronizations) completes (when every time the active-active HA starts). Available only when `mode {active-passive | active-active | standalone}` (page 262) is `active-active`.	`10`
`weight-1 <weight_int>`	When the `system ha` (page 261) algorithm is `ip`, sets the weight for the first unit in an active-active HA cluster. The master unit performs weighted round-robin according to the specified weight to distribute the first packet coming from the source IP to cluster members. The weight of each unit can be set with a range of 0–255.	1
`weight-2 <weight_int>`	When the `schedule` algorithm is `ip`, sets the weight for the second unit in an active-active HA cluster. The master unit performs weighted round-robin according to the specified weight to distribute the first packet coming from the source IP to cluster members. The weight of each unit can be set with a range of 0–255.	1

Variable	Description	Default
`weight-3 <weight_int>`	When the `system ha` (page 261) algorithm is `ip`, sets the weight for the third unit in an active-active HA cluster. The master unit performs weighted round-robin according to the specified weight to distribute the first packet coming from the source IP to cluster members. The weight of each unit can be set with a range of 0–255.	1
`weight-4 <weight_int>`	When the `system ha` (page 261) algorithm is `ip`, sets the weight for the fourth unit in an active-active HA cluster. The master unit performs weighted round-robin according to the specified weight to distribute the first packet coming from the source IP to cluster members. The weight of each unit can be set with a range of 0–255.	1
`weight-5 <weight_int>`	When the `system ha` (page 261) algorithm is `ip`, sets the weight for the fifth unit in an active-active HA cluster. The master unit performs weighted round-robin according to the specified weight to distribute the first packet coming from the source IP to cluster members. The weight of each unit can be set with a range of 0–255.	1
`weight-6 <weight_int>`	When the `system ha` (page 261) algorithm is `ip`, sets the weight for the sixth unit in an active-active HA cluster. The master unit perform weighted round-robin according to the specified weight to distribute the first packet coming from the source IP to cluster members. The weight of each unit can be set with a range of 0–255.	1
`weight-7 <weight_int>`	When the `system ha` (page 261) algorithm is `ip`, sets the weight for the seventh unit in an active-active HA cluster. The master unit performs weighted round-robin according to the specified weight to distribute the first packet coming from the source IP to cluster members. The weight of each unit can be set with a range of 0–255.	1
`weight-8 <weight_int>`	When the `system ha` (page 261) algorithm is `ip`, sets the weight for the eighth unit in an active-active HA cluster.	1

Variable	Description	Default
	The master unit performs weighted round-robin according to the specified weight to distribute the first packet coming from the source IP to cluster members. The weight of each unit can be set with a range of 0–255.	
`session-pickup {enable | disable}`	Enable so that the master unit in the HA cluster synchronizes the session table with all cluster units. If a cluster unit fails, the HA session table information is available to the remaining cluster units which can use the session table to resume connections without interruption. Enable for session fail-over protection. If this is not required, disabling may reduce CPU usage and reduce HA heartbeat network bandwidth usage. **Note**: Only sessions that have been established for longer than 30 seconds will be synchronized.	`disable`
`persistence-sync {enable | disable}`	Enable/disable the persistence synchronization.	`disable`
`eip-addr <class_ip>`	Enter the elastic IP address for HA on AWS.	No default.
`eip-aid <eip-aid_str>`	Enter the ID of the elastic IP for HA on AWS.	No default.
`ha-eth-type <ha-eth-type_str>`	HA heartbeat packet Ethertype (4-digit hex). The range is 0x8890–0x889F.	No default.
`hc-eth-type <hc-eth-type_str>`	Tuple session HA heartbeat packet Ethertype (4-digit hex). The range is 0x8890–0x889F.	No default.
`hbcast-eth-type <hbcast-eth-type_str>`	Broadcast HA heartbeat packet Ethertype (4-digit hex). The range is 0x8890–0x889F.	No default.
`l2ep-eth-type <l2ep-eth-type_str>`	Telnet session HA heartbeat packet Ethertype (4-digit hex). The range is 0x8890–0x889F.	No default.
`l7-persistence-sync {enable | disable}`	When FortiWeb is operating in HA Active-Passive (AP) mode, you can enable Layer 7 Persistence Synchronization. This option enables session synchronization when there's a failover that causes the slave appliance to take over as the new master, and is useful for web applications that require sticky sessions.	`disable`
`server-policy-hlck`	Enable to check the server policy health.	`disable`

Variable	Description	Default
{enable | disable}	Server policy health check is only available if the operation mode is Reverse Proxy, and the HA mode is Active-Active.	

Example

This example configures a FortiWeb appliance as one appliance in an active-passive HA pair whose group ID is 1. The primary heartbeat occurs over port3, and the secondary heartbeat link is over port4. Priority is more important than uptime when electing the main appliance. The appliance will wait 30 seconds after boot time for a heartbeat or synchronization before assuming that it should be that main appliance. Aside from the heartbeat link, failover can also be triggered by port monitoring of port1 and port2.

```
config system ha
   set mode active-passive
   set group-id 1
   set priority 6
   set override enable
   set hbdev port3
   set hbdev-backup port4
   set arps 3
   set arp-interval 2
   set hb-interval 1
   set hb-lost-threshold 3
   set monitor port1 port2
   set boot-time 30
end
```

system ha-aa-server-policy-hlck

To check whether the server policies are running properly on the HA cluster, you can configure server policy heath check. The configurations are synchronized to all members in the cluster. The system sends an HTTP or HTTPS request, and waits for a response that matches the values required by the health check rule. A timeout indicates that the connection between the HA cluster member and the back-end server is not available. The system then generates event logs. The master node will not distribute traffic to this HA member until the connection is recovered.

Server policy health check is only available if the operation mode is **Reverse Proxy**, and the HA mode is **Active-Active**.

You should first enable the **Server Policy Health Check** option on the **HA** tab in **HA Cluster > HA**, or enable it through the command `config system ha`, then configure a health check on the **HA AA Server Policy Health Check** tab.

FortiWeb only supports checking the health of server policies in the root administrative domain.

To use this command, your administrator account's access control profile must have `rw` or `w` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system ha-aa-server-policy-hlck
   edit "<health-check_id>"
      set HTTPS {enable | disable}
      set client-cert <client-certificate-name>
      set relationship {and | or}
      configure health-list
         edit <entry_index>
            set time-out <seconds_int>
            set retry-times <retries_int>
            set interval <seconds_int>
            set url-path "<request_str>"
            set method {get | head | post}
            set match-type {response-code | match-content | all}
            set response-code {response-code_int}
            set match-content "<match-content_str>"
         next
      end
   next
end
```

Variable	Description	Default
`"<health-check_id"`	Enter the ID of the server policy health check. The maximum length is 63 characters. To display the list of existing server health checks, enter: `edit ?`	No default.
`HTTPS {enable | disable}`	Enable to use the HTTPS protocol for the health check connections with the back-end server. The systems uses HTTP protocol if this option is disabled.nd you can configure the client certificate for the connection.	
`client-cert <client-certificate-name>`	If HTTPS is enabled, you can specify a Client Certificate for the connection. This is optional. The Client Certificate is imported on GUI in System > Certificates > Local or by CLI command `config system certificate local`.	
`relationship {and |or}`	• `and`—FortiWeb considers the server to be	`and`

Variable	Description	Default
	responsive when it passes all the tests in the list. • `or`—FortiWeb considers the server to be responsive when it passes at least one of the tests in the list.	
`<entry_index>`	Enter the index number of the individual rule in the table. The valid range is 1–16.	No default.
`timeout <seconds_int>`	Enter the number of seconds which must pass after the server health check to indicate a failed health check. The valid range is 1–10 .	`3`
`retry-times <retries_int>`	Enter the number of times, if any, a failed health check will be retried before the server is determined to be unresponsive. The valid range is 1–10.	`3`
`interval <seconds_int>`	Enter the number of seconds between each server health check. The valid range is from 1–10.	`10`
`url-path "<request_str>"`	Enter the URL, such as `/index.html`, that FortiWeb uses in the HTTP/HTTPS request to verify the responsiveness of the server. If the web server successfully returns this URL, and its content matches the expression specified by `match-content`, FortiWeb considers it to be responsive.	No default.
`method {get | head | post}`	Specify whether the health check uses the HEAD, GET, or POST method.	`get`
`match-type {response-code | match-content | all}`	• `response-code`—If the web server successfully returns the URL specified by `url-path` and the code specified by `response-code`, FortiWeb considers the server to be responsive. • `match-content`—If the web server successfully returns the URL specified by `url-path` and its content matches the `match-content` value, FortiWeb considers the server to be responsive. • `all`—If the web server successfully returns the URL specified by `url-path` and its content matches the `match-content` value, and the code specified by `response-code`, FortiWeb considers the server to be responsive.	`match-content`
`response-code {response-code_int}`	Enter the response code that you require the server to return to confirm that it is available, if `match-type` is `response-code` or `all`.	`200`

Variable	Description	Default
`match-content "<match-content_str>"`	Enter a regular expression that matches the content that must be present in the HTTP reply to indicate proper server connectivity, if `match-type` is `match-content` or `all`.	No default.

Example

This example configures a server policy health check that periodically requests the main page of the website, `/index`. If FortiWeb can't receive responses containing the required page (which contains the word “About”) every 10 seconds (the default), and the check fails at least three times in a row, FortiWeb considers the connection between itself and the server being broken. The master node will then stop distributing traffic to this HA member until the connection is recovered.

```
config config system ha-aa-server-policy-hlck
   edit "status_check1"
      set trigger-policy "notification-servers1"
      configure health-list
         edit 1
            set type http
            set retry-times 3
            set url-path "/index"
            set method get
            set match-type match-content
            set regular About
   next
end
```

system ha-mgmt-router-static

For a FortiWeb applicance in an HA group, the configurations set by `config router policy` and `config router static` are synchronized by all the group members, but the configurations set by `HA Mgmt Static Route` or `HA Mgmt Policy route` are applied only to this specific member.

Use this command to add or delete a static route that is used only by this HA member. It is useful when you want to connect this cluster member to back-end servers that are not in the server pool of the HA group.

To use this command, your administrator account’s access control profile must have `rw` or `w` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system ha-mgmt-router-static
   edit <route_index>
      set device "<interface_name>"
      set dst "<destination_ip>"
      set gateway "<router_ip>"
   next
end
```

Variable	Description	Default
`<route_index>`	Enter the index number of the static route. If multiple routes match a packet, the one with the smallest index number is applied. The valid range is 0–65,535.	No default.
`device "<interface_name>"`	Enter the name of the network interface, such as `port1`, through which traffic subject to this route will be outbound. The maximum length is 63 characters.	No default.
`dst "<destination_ip>"`	Enter the destination IP address and netmask of traffic that will be subject to this route, separated with a space. To indicate all traffic regardless of IP address and netmask (that is, to configure a route to the default gateway), enter `0.0.0.0 0.0.0.0` or `::/0`.	`0.0.0.0 0.0.0.0`
`gateway "<router_ip>"`	Enter the IP address of a next-hop router. **Caution:** The gateway IP address must be in the same subnet as the interface's IP address. If you change the interface's IP address later, the new IP address must also be in the same subnet as the interface's default gateway address. Otherwise, all static routes and the default gateway will be lost. **Note:** Only one default route (the static route with destination as 0.0.0.0/0) is allowed on FortiManager appliance. For example, if you have configured a default route in **System > Network > Route**, then it's not allowed to configure another default route in HA route settings.	`0.0.0.0`

system ha-mgmt-router-policy

For a FortiWeb applicance in an HA group, the configurations set by `config router policy` and `config router static` are synchronized by all the group members, but the configurations set by `HA Mgmt Static Route` or `HA Mgmt Policy route` are applied only to this specific member.

Use this command to add or delete a policy route that is used only by this HA member. It is useful when you want to connect this cluster member to back-end servers that are not in the server pool of the HA group.

To use this command, your administrator account's access control profile must have `rw` or `w` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system ha-mgmt-router-policy
  edit <policy_index>
    set iif <incoming_interface_name>
```

```
        set src <source_ip>
        set dst <destination_ip>
        set oif <outgoing_interface_name>
        set gateway <router_ip>
        set priority <priorty_int>
    next
end
```

Variable	Description	Default
<policy_index>	Enter the index number of the policy route. The valid range is 0–65,535.	No default.
iif <incoming_interface_name>	Enter the name of the interface, such as port1, on which FortiWeb receives packets it applies this routing policy to.	No default.
src <source_ip>	Enter the source IP address and netmask to match, separated with a space. FortiWeb routes matching traffic through the specified interface and gateway.	0.0.0.0 0.0.0.0
dst <destination_ip>	Enter the destination IP address and netmask to match, separated with a space. FortiWeb routes matching traffic through the specified interface and gateway.	0.0.0.0 0.0.0.0
oif <outgoing_interface_name>	Enter the name of the interface, such as port2, through which FortiWeb routes packets that match the specified IP address information.	No default.
gateway <router_ip>	Enter the IP address of a next-hop router. A gateway address is not required for the particular routing policies used as static routes in an one-arm topology. Leave this blank for a one-arm network topology.	0.0.0.0
priority <priorty_int>	Enter a value between 1 and 200 that specifies the priority of the route. When packets match more than one policy route, FortiWeb directs traffic to the route with the lowest value.	200

system hsm info

Use this command to edit the configuration so that FortiWeb will work with SafeNet Luna SA HSM (hardware security module). The HSM integration allows FortiWeb to retrieve a per-connection SSL session key instead of loading the local private key and certificate.

Because the HSM configuration requires you to upload a server certificate, you can create it using the web UI only. After you create the configuration in the web UI, this command allows you to edit it.

For detailed information on integrating HSM with FortiWeb, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

Before you can show or edit HSM configuration in the CLI and access HSM settings in the web UI, use the following command to enable the HSM settings:

```
config server-policy setting
   set hsm enable
```

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system hsm info
   set ip "<hsm_ipv4>"
   set port <port_int>
   set timeout <timeout_int>
   set filename "<filename_str>"
   set action {register | unregister}
end
```

Variable	Description	Default
`ip "<hsm_ipv4>"`	Enter the IP address of the HSM.	No default.
`port <port_int>`	Enter the port where FortiWeb establishes an NTLS connection with the HSM.	`1792`
`timeout <timeout_int>`	Enter a timeout value for the connection between HSM and FortiWeb.	No default.
`filename "<filename_ str>"`	Shows the name of the server certificate file from the HSM. You cannot edit this option using the CLI.	No default.
`action {register | unregister}`	Enter `register` to register FortiWeb as a client of the HSM.	No default.

system hsm partition

Use this command to edit information about the partition that the FortiWeb HSM client is assigned to. The partition settings are part of the configuration that allows FortiWeb to work with SafeNet Luna SA HSM (hardware security module).

Before you can show or edit HSM configuration in the CLI and access HSM settings in the web UI, use the following command to enable the HSM settings:

```
config server-policy setting
   set hsm enable
```

For additional HSM integration settings, see "system hsm info" on page 278.

For detailed information on integrating HSM with FortiWeb, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system hsm partition
   edit "<partition_name>"
      set password <password_int>
end
```

Variable	Description	Default
"<partition_name>"	Enter the name of a partition that the FortiWeb HSM client is assigned to.	No default.
password <password_int>	Enter the partition password.	No default.

system interface

Use this command to configure:

- The network interfaces associated with the physical network ports of the FortiWeb appliance
- VLAN subinterfaces or 802.3ad link aggregates associated with physical network interfaces

Both the network interfaces and VLAN subinterfaces can include administrative access.

You can restrict which IP addresses are permitted to log in as a FortiWeb administrator through the network interfaces and VLAN subinterfaces. For details, see "system admin" on page 193.

When the FortiWeb appliance is operating in either of the transparent modes, VLANs do not support Cisco discovery protocol (CDP).

You can use SNMP traps to notify you when a network interface's configuration changes, or when a link is brought down or brought up. For details, see "system snmp community" on page 301.

To use this command, your administrator account's access control profile must have either `rw` permission to the `netgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system interface
  edit "<interface_name>"
    set status {up | down}
    set type {aggregate | physical | vlan | redundant}
    set algorithm {layer2 | layer2_3 | layer3_4}
    set allowaccess {http https ping snmp ssh telnet FWB-manager}
    set ip6-allowaccess {http https ping snmp ssh telnet FWB-manager}
    set wccp {enable | disable}
    set description "<comment_str>"
    set interface "<interface_name>"
    set intf {"<port_name>" ...}
    set ip "<interface_ipv4mask>"
    set ip6 "<interface_ipv6mask>"
    set mode {static | dhcp}
    set ip6-mode {static | dhcp}
    set vlanid <vlan-id_int>
    set vlanproto {8021q | 8021ad}
    set lacp-speed {fast | slow}
    set mtu <mtu_int>
    set system interface
    set system interface
    set system interface
    set system interface
    config secondaryip
      edit <entry_index>
        set ip {"<interface_ipv4mask>" | "<interface_ipv6mask>"}
      next
      end
    next
```

```
end
```

Variable	Description	Default
"<interface_name>"	Enter the name of a network interface. The maximum length is 15 characters.	No default.
status {up | down}	Enable (select up) to bring up the network interface so that it is permitted to receive and/or transmit traffic. **Note:** This administrative status from this command is **not** the same as its detected physical link status. For example, even though you have used config system interface to configure port1 with set status up, if the cable is physically unplugged, diagnose hardware nic list port1 may indicate correctly that the link is down (Link detected: no).	up
algorithm {layer2 | layer2_3 | layer3_4}	Select the connectivity layers that will be considered when distributing frames among the aggregated physical ports. • layer2—Consider only the MAC address. This results in the most even distribution of frames, but may be disruptive to TCP if packets frequently arrive out of order. • layer2_3—Consider both the MAC address and IP session. Queue frames involving the same session to the same port. This results in slightly less even distribution, and still does not guarantee perfectly ordered TCP sessions, but does result in less jitter within the session. • layer3_4—Consider both the IP session and TCP connection. Queue frames involving the same session and connection to the same port. Distribution is not even, but this does prevent TCP retransmissions associated with link aggregation.	layer2
allowaccess {http https ping snmp ssh telnet FWB-manager}	Enter the IPv4 protocols that will be permitted for administrative connections to the network interface or VLAN subinterface. Separate each protocol with a space. To remove from or add to the list of permitted administrative access protocols, retype the entire list. • ping—Allow ICMP ping responses from this network interface. • http—Allow HTTP access to the web UI. **Caution:** HTTP connections are **not** secure and can be intercepted by a third party. To reduce risk to the security	ping https ssh

Variable	Description	Default
	of your FortiMail appliance, enable this option only on network interfaces connected directly to your management computer. • `https`—Allow secure HTTP (HTTPS) access to the web UI. • `snmp`—Allow SNMP access. For details, see "system snmp community" on page 301. **Note:** This setting only configures which network interface will **receive** SNMP queries. To configure which network interface will **send** traffic, see "system snmp community" on page 301. • `ssh`—Allow SSH access to the CLI. • `telnet`—Allow Telnet access to the CLI. **Caution:** Telnet connections are **not** secure. • `FWB-manager` — Allow FortiWeb Manager to use this interface to administer this appliance. **Caution:** Enable administrative access only on network interfaces or VLAN subinterfaces that are connected to trusted private networks or directly to your management computer. If possible, enable only secure administrative access protocols such as HTTPS or SSH. Failure to restrict administrative access could compromise the security of your FortiWeb appliance. Consider allowing ping only when troubleshooting.	
`ip6-allowaccess {http https ping snmp ssh telnet FWB-manager}`	Enter the IPv6 protocols that will be permitted for administrative connections to the network interface or VLAN subinterface. Separate each protocol with a space. To remove from or add to the list of permitted administrative access protocols, retype the entire list. • `ping`—Allow ICMP ping responses from this network interface. • `http`—Allow HTTP access to the web UI. **Caution:** HTTP connections are **not** secure and can be intercepted by a third party. To reduce risk to the security of your FortiMail appliance, enable this option only on network interfaces connected directly to your management computer. • `https`—Allow secure HTTP (HTTPS) access to the web	`ping`

Variable	Description	Default
	UI. • `snmp`—Allow SNMP access. For details, see "system snmp community" on page 301. **Note:** This setting only configures which network interface will **receive** SNMP queries. To configure which network interface will **send** traffic, see "system snmp community" on page 301. • `ssh`—Allow SSH access to the CLI. • `telnet`—Allow Telnet access to the CLI. **Caution:** Telnet connections are **not** secure. • `FWB-manager` — Allow FortiWeb Manager to use this interface to administer this appliance. **Caution:** Enable administrative access only on network interfaces or VLAN subinterfaces connected to trusted private networks or directly to your management computer. If possible, enable only secure administrative access protocols such as HTTPS or SSH. Failure to restrict administrative access could compromise the security of your FortiWeb appliance. Consider allowing ping only when troubleshooting.	
`wccp {enable | disable}`	Specify whether FortiWeb uses the interface to communicate with a FortiGate unit configured as a WCCP server. Available only when the operation mode is WCCP.	`disable`
`description "<comment_str>"`	Enter a description or other comment. If the comment is more than one word or contains an apostrophe, surround the comment with double quotes (`"`). The maximum length is 63 characters.	No default.
`interface "<interface_name>"`	Enter the name of the network interface with which the VLAN subinterface will be associated. The maximum length is 15 characters. This field is available only if `type {aggregate | physical | vlan | redundant}` (page 285) is `vlan`.	No default.
`intf {"<port_name>" ...}`	Enter the names of 2 physical network interfaces or more that will be combined into the aggregate link. Only physical network interfaces may be aggregated. The maximum length is 15 characters each. This field is available only if `type {aggregate | physical | vlan | redundant}` (page 285) is `vlan`.	No default.

Variable	Description	Default
`ip "<interface_ipv4mask>"`	Enter the IPv4 address and netmask of the network interface, if any. The IP address must be on the same subnet as the network to which the interface connects. Two network interfaces cannot have IP addresses on the same subnet. The default setting for port1 is `192.168.1.99` with a netmask of `255.255.255.0`. Other ports have no default.	Varies by the interface.
`ip6 "<interface_ipv6mask>"`	Enter the IPv6 address and netmask of the network interface, if any. The IP address must be on the same subnet as the network to which the interface connects. Two network interfaces cannot have IP addresses on the same subnet.	`::/0`
`lacp-speed {fast | slow}`	Select the rate of transmission for the LACP frames (LACPUs) between FortiWeb and the peer device at the other end of the trunking cables, either: • **SLOW**—Every 30 seconds. • **FAST**—Every 1 second. **Note:** This must match the setting on the other device. If the rates do not match, FortiWeb or the other device could mistakenly believe that the other's ports have failed, effectively disabling ports in the trunk.	`slow`
`type {aggregate | physical | vlan | redundant}`	Indicates whether the interface is directly associated with a single physical network port, a group of redundant interfaces, or is instead a VLAN subinterface or link aggregate. The default varies by whether you are editing a network interface associated with a physical port (`physical`) or creating a new subinterface/aggregate (`vlan` or `aggregate`).	Varies by the interface.
`mode {static | dhcp}`	Specify whether the interface obtains its IPv4 address and netmask using DHCP.	`static`
`ip6-mode {static | dhcp}`	Specify whether the interface obtains its IPv6 address and netmask using DHCP.	`static`
`vlanid <vlan-id_int>`	Enter the VLAN ID of packets that belong to this VLAN subinterface. • If one physical network port (that is, a VLAN trunk) will handle multiple VLANs, create multiple VLAN subinterfaces on that port, one for each VLAN ID that will be received. • If multiple, different physical network ports will handle the same VLANs, on each of the ports, create VLAN	`0`

Variable	Description	Default
	subinterfaces that have the same VLAN IDs. The VLAN ID is part of the tag that is inserted into each Ethernet frame in order to identify traffic for a specific VLAN. VLAN header addition is handled automatically, and does not require that you adjust the maximum transmission appliance (MTU). Depending on whether the device receiving a packet operates at Layer 2 or Layer 3 of the network, this tag may be added, removed or rewritten before forwarding to other nodes on the network. For example, a Layer 2 switch or FortiWeb appliance operating in either of the transparent modes would typically add or remove a tag when forwarding traffic among members of the VLAN, but would **not** route tagged traffic to a different VLAN ID. In contrast, a FortiWeb appliance operating in Reverse Proxy mode, inspecting the traffic to make routing decisions based upon higher-level layers/protocols, might route traffic between different VLAN IDs (also known as inter-VLAN routing) if indicated by its policy, such as if it has been configured to do WSDL-based routing. For the maximum number of interfaces, including VLAN subinterfaces, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides This field is available only when `type {aggregate | physical | vlan | redundant}` (page 285) is `vlan`. The valid range is between 1 and 4094 and must match the VLAN ID added by the IEEE 802.1q-compliant router or switch connected to the VLAN subinterface.	
`vlanproto {8021q | 8021ad}`	Select either the VLAN type 802.1Q or 802.1ad.	`802.1Q`
`<entry_index>`	Enter the index number of the individual entry in the table.	No default.
`ip {"<interface_ipv4mask>" | "<interface_ipv6mask>"}`	Type an additional IPv4 or IPv6 address and netmask for the network interface. Available only when `ip-src-balance` or `ip6-src-balance` is enabled. For details, see "system network-option" on page 289.	No default.
`mtu <mtu_int>`	Enter the maximum transmission unit (MTU) that the interface supports. Valid values are 512–9216 (for IPv4) or 1280–9216 (for IPv6).	`1500`

Variable	Description	Default
	You cannot specify an MTU for a VLAN interface that is larger than the MTU of the corresponding physical interface.	

Example

This example configures the network interface named port1, associated with the first physical network port, with the IP address and subnet mask `192.0.2.1/24`. It also enables ICMP `ECHO` (ping) and HTTPS administrative access to that network interface, and enables it.

```
config system interface
   edit "port1"
      set ip "192.0.2.1 255.255.255.0"
      set allowaccess ping https
      set status up
   next
end
```

Example

This example configures the network subinterface named vlan_100, associated with the physical network interface port1, with the IP address and subnet mask `192.0.2.1/24`. It does not allow administrative access.

```
config system interface
   edit "vlan_100"
      set type vlan
      set ip "192.0.2.1 255.255.255.0"
      set status up
      set vlanid 100
      set interface "port1"
   next
end
```

system ip-detection

Use this command to configure how FortiWeb analyzes the identification (ID) field in IP packet headers in order to distinguish source IP addresses that are actually Internet connections shared by multiple clients, not single clients.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system ip-detection
   set share-ip-detection-level {low | medium | high}
end
```

Variable	Description	Default
`share-ip-detection-level {low | medium | high}`	Select how different packets' ID fields can be before FortiWeb detects that an IP is shared by multiple clients.	`low`

Related topics

- "system advanced" on page 201

system manager-mode

Use this command to configure the auto-scaling cluster.

Syntax

```
config system manager
      set mode {server | client | standalone}
      set server-type {physical}
      set server-ip <server_ip_address>
      set server-port <integer>
      set config-sync-port <integer>
      set connection-interval <integer>
      set connection-lost-threshold <integer>
      set callback-url <string>
      set server-public-ip <server_public_ip_address>
   next
end
```

Variable	Description	Default
`mode {server | client | standalone}`	After the VMs in auto-scaling cluster are deployed, the function APP elects a server VM. You can use this command to change the role of the VM.	No default.

Variable	Description	Default
`server-type {physical}`	Currently we only support physical server. More types will be supported in future releases.	physical
`server-ip <server_ip_address>`	Enter port1's IP address of the server.	No default.
`server-port`	Enter a TCP port number. The clients use the `server-ip` and `server-port` to communicate with the server.	No default.
`config-sync-port <integer>`	Enter the port that is used for configuration synchronization. The configurations of the server will be synchronized to all the clients in the cluster.	No default.
`connection-interval <integer>`	Enter the number of seconds between each server-client connection. The valid range is from 1–10.	10
`connection-lost-threshold <integer>`	Enter the number of seconds which must pass after the server confirmed that the client's connection is lost. The valid range is 1–10 .	3
`callback-url <string>`	The URL of the function APP. The VMs in the auto-scaling cluster uses this URL to communicate with the function APP. This URL is broadcasted to all the VMs in the cluster when they are deployed, so that they can communicate with the function APP. The function APP will then elect a server VM among all the available VMs.	No default.
`server-public-ip`	The public IP address of the Server. You can use this address to access the server's GUI and CLI.	No default.

system network-option

Use this command to configure system-wide TCP connection options.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `netgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system network-option
   set tcp-timestamp {enable | disable}
   set tcp-tw-recycle {enable | disable}
   set ip-src-balance {enable | disable}
   set ip6-src-balance {enable | disable}
   set tcp-buffer {default | high | max}
   set arp_ignore {enable | disable}
```

```
    set loopback-mtu <loopback-mtu_int>
    set tcp-usertimeout <tcp-usertimeout_int>
    set tcp-keepcnt <tcp-keepcnt_int>
    set tcp-keepidle <tcp-keepidle_int>
    set tcp-keepintvl <tcp-keepintvl_int>
    set loopback-tso-gso {enable | disable}
    set route-priority {system | dhcp}
    set dns-priority {system | dhcp}
    set dns-cache-timeout <dns-cache-timeout_int>
    set tcp-mtu-probing {enable | disable}
  end
```

Variable	Description	Default
`tcp-timestamp {enable | disable}`	Enable to: • Verify whether clients' TCP timestamps are sequential • Include TCP timestamps in packets from FortiWeb Disabling this option can be useful when multiple clients are in front of a source NAT gateway such as a FortiGate. If it applies source NAT but forwards packets to FortiWeb **without** modifying the TCP timestamp, packets received from that source IP will appear to FortiWeb to have an unstable timestamp. FortiWeb will therefore drop out-of-sequence packets. Disabling therefore prevents packets dropped due to this cause, and can improve performance in that case. **Caution:** Disabling this option affects FortiWeb's dynamic calculation of TCP retransmission timeout (RTO) and therefore round trip time (RTT). If you disable the timestamp when it is not necessary, this can result in decreased application performance.	`enable`
`tcp-tw-recycle {enable | disable}`	Enable to quickly recycle sockets that are ready to close (i.e. in the `TIME_WAIT` state per the TCP RFC). This option can be useful in networks with both sustained high load and bursts of new connection requests. If all sockets are busy, new connection requests may be refused. Enabling this option frees sockets more quickly. **Caution:** Enabling this option can cause issues with external load balancers and HA failover if they are not expecting the connection to close quickly. This can result in decreased application performance. Generally, it is safer to wait for sockets to safely close before they are reused.	`disable`
`ip-src-balance {enable | disable}`	Enable to allow FortiWeb to connect to the back-end servers using more than one IPv4 address. FortiWeb uses a round-robin load-balancing algorithm to distribute the connections among the available IP addresses.	`disable`

Variable	Description	Default
	To specify the additional IP addresses, see "system interface" on page 281. This option is useful for performance testing when the number of concurrent connections between FortiWeb and a back-end server exceeds the number of ports that a single IP can provide.	
`ip6-src-balance {enable | disable}`	Enable to allow FortiWeb to connect to the back-end servers using more than one IPv6 address. FortiWeb uses a round-robin load-balancing algorithm to distribute the connections among the available IP addresses. To specify the additional IP addresses, see "system interface" on page 281.	`disable`
`tcp-buffer {default | high | max}`	Specify `high` or `max` to increase the size of the TCP buffer. This option is useful when amount of traffic between a server pool member and FortiWeb is significantly larger than traffic between FortiWeb and the client.	`default`
`arp_ignore {enable | disable}`	Specify how FortiWeb responds to ARP requests. • `disable`—Reply for any local target IP address, configured on any interface. • `enable`—Reply only if the target IP address is local address configured on the incoming interface.	`disable`
`loopback-mtu <loopback-mtu_int>`	If the operation mode is True Transparent Proxy, specify a global MTU for v-zones. **Caution:** If this value is smaller than a v-zone's MTU, this value replaces the larger value in the v-zone configuration. Available only when the operation mode is True Transparent Proxy.	`65536`
`tcp-usertimeout <tcp-usertimeout_int>`	Enter how long FortiWeb waits before it closes the connection with a client that is not sending any data or responding with ACK to keepalive packets, in seconds.	`120`
`tcp-keepcnt <tcp-keepcnt_int>`	Enter only if no value is specified for `tcp-usertimeout <tcp-usertimeout_int>` (page 291). Fortinet recommends that you always specify a `tcp-usertimeout` value.	`3`
`tcp-keepidle <tcp-keepidle_int>`	Enter how long FortiWeb waits before it sends a client or server that keeps a connection with FortiWeb open without	`60`

Variable	Description	Default
	sending data a keepalive packet, in seconds.	
`tcp-keepintvl <tcp-keepintvl_int>`	Enter how often FortiWeb sends a keepalive packet to a client that keeps a connection open without sending data, in seconds.	`20`
`loopback-tso-gso {enable | disable}`	Used for debugging.	`disable`
`route-priority {system | dhcp}`	Configure the priority of route IP address obtained by the system and dhcp, whose route IP address has the priority.	No default
`dns-priority {system | dhcp}`	Configure the priority of DNS obtained by the system and dhcp, whose DNS has the priority.	No default
`dns-cache-timeout <dns-cache-timeout_int>`	Configure how long the DNS proxy cache expires. The valid range is 0~60 (minutes). Only integers are supported. For example, if the value is set to 3, the DNS proxy queries the DNS records from the DNS server and renews the records in the cache every 3 minutes. Please note that if the DNS records in the DNS server are changed during the 3-minute interval, and a client requests for a connection to the domain at this point, the connection will fail because the DNS record stored in the DNS proxy cache is not valid anymore. To avoid this problem, you can set the `dns-cache-timeout` to a smaller value, so that the DNS proxy renews its cache more frequently. You can also set it to 0 (the default value), which means the DNS proxy doesn't cache the DNS records. It initiates query to the DNS server whenever there is a request to look up the DNS records.	`0`
`tcp-mtu-probing {enable | disable}`	Enable to negotiate with the upstream and downstream switches to get the maximum MTU value. Adjust the MTU accordingly for actual need.	`disable`

Example

This example assigns additional IP addresses to port1. FortiWeb uses a round-robin load-balancing algorithm to distribute connections to back-end servers among the available IP addresses.

```
config system network-option
   set ip-src-balance enable
end

config system interface
   edit port1
      set type physical
      set ip 192.0.2.71/24
      set allowaccess https ping ssh snmp http telnet
```

```
      config secondaryip
        edit 1
          set ip 192.0.2.72/24
        next
        edit 2
          set ip 192.0.2.73/24
        next
      end
    next
end
```

system password-policy

Use this command to configure a password policy for administrator accounts that set rules for password characteristics.

Syntax

```
config system password-policy
  set status {enable | disable}
  set min-length-option {enable | disable}
  set mini-length <mini-length_int>
  set single-admin-mode {enable | disable}
  set character-requirements {enable | disable}
  set min-upper-case-letter <min-upper-case-letter_int>
  set min-lower-case-letter <min-lower-case-letter_int>
  set mini-number <mini_number_int>
  set min-non-alphanumeric <min-non-alphanumeric_int>
  set forbid-password-reuse {enable | disable}
  set history-password-number <history-password-number_int>
  set expire-status {enable | disable}
  set expire-day <expire-day_int>

end
```

Variable	Description	Default
`status {enable | disable}`	Enable to enforce password rules for administrator accounts. When you configure rules for the password policy, administrator accounts that don't adhere to the password policy will be prompted to update their password upon logging in. For some cloud platforms such as AWS, Azure,	`disable`

Variable	Description	Default
	and GCP, etc., it is enabled by default.	
`min-length-option {enable | disable}`	Enable/disable to set the minimum length for the password.	`disable`
`mini-length <mini-length_int>`	Enter the minimum password length. The valid range is 8–128.	`8`
`single-admin-mode {enable | disable}`	Enable/disable to activate single admin user login.	`disable`
`character-requirements {enable | disable}`	Enable/disable to set characters, upper/lower case, numbers (0–9), and special.	`0`
`min-upper-case-letter <min-upper-case-letter_int>`	Enter the number of upper case characters. The valid range is 0–128.	`0`
`min-lower-case-letter <min-lower-case-letter_int>`	Enter the number of lower case characters. The valid range is 0–128.	`0`
`mini-number <mini_number_int>`	Enter the number of number characters. The valid range is 0–128. Only numbers 0–9 are supported.	`0`
`min-non-alphanumeric <min-non-alphanumeric_int>`	Enter the number of special characters. The valid range is 0–128.	`0`
`forbid-password-reuse {enable | disable}`	Enable forbidding password re-use.	`disable`
`history-password-number <history-password-number_int>`	Enter the number of history passwords that can not be re-used. The valid range is 1–10.	`3`
`expire-status {enable | disable}`	Enable password expiration.	`disable`
`expire-day <expire-day_int>`	Enter the valid period for the password. The valid range 1–999 days	`90`

Example

This example enables configuration of the password policy.

```
config system password-policy
   set status enable
   set system password-policy
   set min-length 8
   set single-admin-mode enable
   set character-requirements enable
   set min-upper-case-letter 2
   set min-lower-case-letter 2
   set min-number 2
```

```
    set min-non-alphanumeric 3
    set forbid-password-reuse enable
    set history-password-number 2
    set expire-status enable
    set expire-day 100

end
```

system raid

Use this command to configure the RAID level.

Currently, only RAID level 1 is supported, and only on the following models shipped with FortiWeb 4.0 MR1 or later:

- FortiWeb-1000B
- FortiWeb-1000C
- FortiWeb-1000D
- FortiWeb-1000E
- FortiWeb-2000E
- FortiWeb-3000C
- FortiWeb-3000D
- FortiWeb-3000E
- FortiWeb-4000C
- FortiWeb-4000D
- FortiWeb-4000E

On older appliances that have been upgraded to FortiWeb 4.0 MR1 or later, RAID cannot be activated.

Back up the data regularly. RAID is not a substitute for regular backups. RAID 1 (mirroring) is designed to improve hardware fault tolerance, but cannot negate all risks.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system raid
   set level {raid1}
end
```

Variable	Description	Default
`level {raid1}`	Enter the RAID level. Currently, only RAID level 1 is supported.	`raid1`

Example

This example sets RAID level 1.

```
config system raid
   set level raid1
end
```

- "hardware raid list" on page 614

system replacemsg

Use this command to customize the following FortiWeb HTML pages:

- Pages that FortiWeb presents to clients when it authenticates users. FortiWeb uses these pages when you configure a site publishing configuration to use HTML form authentication for its client authentication method. For details, see "waf site-publish-helper rule" on page 485.
- The error page FortiWeb uses to respond to an HTTP request that violates a policy that responds to violations with the action alert and deny or period block.
- The “Server Unavailable!” page that FortiWeb returns to the client when none of the server pool members are available either because they are disabled or in maintenance more, or they have failed the configured health check.

When you specify the HTML code for the web pages using the `buffer` setting, you enter the complete HTML code with changes, even if you are only changing a word or fixing a typographical error. The web UI provides a more convenient editing method that allows you to see the effect of your changes as you edit.

FortiWeb uses these pages for all server policies. If you require a page content that is customized for a specific policy, create an ADOM that contains the custom pages for that policy.

To use this command, your administrator account’s access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system replacemsg
   edit {url-block | server-inaccessible | login | token | rsa-login | rsa-challenge |
       pre-login-disclaimer}
      set buffer "<buffer_str>"
      set code <code_int>
      set set format {html | none | text}
      set set group {alert | site-publish}
      set set header {8 bit | HTTP | no header type}
end
```

Variable	Description	Default
`{url-block | server-inaccessible | login | token | rsa-login | rsa-challenge | pre-login-disclaimer}`	Enter one of the following options to specify the page to modify: • `url-block`—Attack block page • `server-inaccessible`—Server unavailable message • `login`—Authentication login page • `token`—Token authentication page • `rsa-login`—RSA SecurID authentication page • `rsa-challenge`—RSA SecurID challenge page • `pre-login-disclaimer`—A login disclaimer message for administrators logging in to FortiWeb	No default
`buffer "<buffer_str>"`	Enter the HTML content for the page. Because the code for an web page is usually more than one word and contains special characters, surround it with double quotes (`"`).	Preset HTML content
`code <code_int>`	If you are editing the `url-block` item, specify the HTTP page return code as an integer. You cannot edit this setting for other HTML pages.	`500`
`set format {html | none | text}`	Specifies the format of the replacement message. Currently, all messages are HTML. Cannot be changed from the default.	`html`
`set group {alert | site-publish}`	Specifies whether the replacement page is used for security features (blocking and server unavailable) or site publishing feature. Cannot be changed from the default.	`alert` (`url-block`, `server-inaccessible`) site-publish (`login`, `token`, `rsa-login`, `rsa-challenge`)
`set header {8 bit | HTTP | no header type}`	Specifies the header type for the message. Cannot be changed from the default.	`HTTP`

Related topics

- "system replacemsg-image" on page 298

system replacemsg-image

Use this command to add images that the FortiWeb HTML web pages can use. These pages are the ones that FortiWeb uses for blocking, authentication, and unavailable servers.

You cannot edit the images that FortiWeb provides by default.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system replacemsgimage
   edit "<image_name>"
      set image-type {gif | jpg | png | tiff}
      set image-base64 <image_code>
end
```

Variable	Description	Default
`"<image_name>"`	Enter the name of the image to add.	No default
`image-type {gif | jpg | png | tiff}`	Specify the image file format of the image to add.	No default
`image-base64 <image_code>`	Enter the HTTP page return code as clear text, Base64-encoded. Ensure the value has the following properties: • Its length is divisible by 4 (a rule of Base64 encoding) • It begins with characters that identify its format (for example, R0lGO for GIF, iVBORw0K for PNG) • The format matches the value of `image-type`	No default

system settings

Use this command to configure the operation mode and gateway of the FortiWeb appliance.

You will usually set the operation mode once, during installation. Exceptions include if you install the FortiWeb appliance in Offline Protection mode for evaluation purposes, before deciding to switch to another mode for more feature support in a permanent deployment.

Back up your configuration before changing the operation mode. Changing modes deletes any policies not applicable to the new mode, TCP `SYN` flood protection settings, all static routes, all V-zone (bridge) IPs, and all VLANs. You must re-cable your network topology to suit the operation mode, unless you are switching between the two transparent modes, which have similar network topology requirements.

The physical topology must match the operation mode. You may need to re-cable your deployment after changing this setting. For details, see the *FortiWeb Installation Guide*.

There are four operation modes:

- **Reverse proxy**—Requests are destined for a virtual server's network interface and IP address on the FortiWeb appliance. The FortiWeb appliance applies the first applicable policy, then forwards permitted traffic to a real web server. The FortiWeb appliance logs, blocks, or modifies violations according to the matching policy and its protection profile. **Most features are supported.**
- **Offline Protection** — Requests are destined for a real web server instead of the FortiWeb appliance; traffic is duplicated to the FortiWeb through a span port. The FortiWeb appliance monitors traffic received on the virtual server's network interface (regardless of the IP address) and applies the first applicable policy. Because it is not inline with the destination, it does **not** forward permitted traffic. The FortiWeb appliance logs or blocks violations according to the matching policy and its protection profile. If FortiWeb detects a malicious request, it sends a TCP RST (reset) packet to the web server and client to attempt to terminate the connection. It does **not** otherwise modify traffic. (It cannot, for example, apply SSL, load-balance connections, or support user authentication.)

  Unlike in Reverse Proxy mode or True Transparent Proxy mode, actions other than **Alertcannot** be guaranteed to be successful in Offline Protection mode. The FortiWeb appliance will attempt to block traffic that violates the policy by mimicking the client or server and requesting to reset the connection. However, the client or server may receive the reset request after it receives the other traffic due to possible differences in routing paths.

  Most organizations do **not** permanently deploy their FortiWeb appliances in Offline Protection mode. Instead, they will use Offline Protection as a way to learn about their web servers' protection requirements and to form some of the appropriate configuration during a transition period, after which they will switch to one of the operation modes that places the appliance inline between all clients and all web servers.

  Switching out of Offline Protection mode when you are done with transition can prevent bypass problems that can arise as a result of misconfigured routing. It also offers you the ability to offer some protection features that cannot be supported in a span port topology used with offline detection.
- **True transparent proxy** — Requests are destined for a real web server instead of the FortiWeb appliance. The FortiWeb appliance **transparently proxies** the traffic arriving on a network port that belongs to a Layer 2 bridge, applies the first applicable policy, and lets permitted traffic pass through. The FortiWeb appliance logs, blocks, or modifies violations according to the matching policy and its protection profile. **No changes to the IP address scheme of the network are required.** This mode supports user authentication via HTTP but **not** HTTPS.
- **Transparent Inspection** — Requests are destined for a real web server instead of the FortiWeb appliance. The FortiWeb appliance **asynchronously inspects** traffic arriving on a network port that belongs to a Layer 2 bridge, applies the first applicable policy, and lets permitted traffic pass through. The FortiWeb appliance logs or blocks traffic according to the matching policy and its protection profile, but does **not** otherwise modify it. (It cannot, for example, apply SSL, load-balance connections, or support user authentication.

Unlike in Reverse Proxy mode or True Transparent Proxy mode, actions other than **Alertcannot** be guaranteed to be successful in Transparent Inspection mode. The FortiWeb appliance will attempt to block traffic that violates the policy. However, due to the nature of asynchronous inspection, the client or server may have already received the traffic that violated the policy.

The default operation mode is Reverse Proxy.

Feature support varies by operation mode. For details, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

You can use SNMP traps to notify you if the operation mode changes. For details, see "system snmp community" on page 301.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system settings
   set opmode {offline-protection | reverse-proxy | transparent | transparent-
       inspection | wccp}
   set gateway "<router_ipv4>"
   set stop-guimonitor {enable | disable}
   set enable-cache-flush {enable | disable}
   set enable-debug-log {enable | disable}
   set enable-machine-learning-debug {enable | disable}
   set enable-file-upload {enable | disable}
end
```

Variable	Description	Default
`opmode {offline-protection | reverse-proxy | transparent | transparent-inspection | wccp}`	Select the operation mode of the FortiWeb appliance. If you have not yet adjusted the physical topology to suit the new operation mode, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides You may also need to reconfigure IP addresses, VLANs, static routes, bridges, policies, TCP `SYN` flood prevention, and virtual servers, and on your web servers, enable or disable SSL. **Note:** If you select `offline-protection`, you can configure the port from which TCP `RST` (reset) commands are sent to block traffic that violates a policy. For details, see `block-port <port_int>` (page 139).	`reverse-proxy`
`gateway "<router_ipv4>"`	Type the IPv4 address of the default gateway.	`none`

Variable	Description	Default
	This setting is visible only if `opmode {offline-protection | reverse-proxy | transparent | transparent-inspection | wccp}` (page 300) is either True Transparent Proxy, Transparent Inspection, or WCCP. FortiWeb will use the `gateway` setting to create a corresponding static route under router static with the first available index number. Packets will egress through `port1`, the hard-coded management network interface for the transparent operation modes.	
`stop-guimonitor {enable | disable}`	Enable to configure FortiWeb to stop checking whether the process that generates the web UI (httpsd) is defunct. In some cases, a process that has completed execution can still have an entry in the process table, which can create a resource leak. When this setting is disabled, FortiWeb checks the process and stops and reloads the web UI if it determines that the process is defunct.	`enable`
`enable-cache-flush {enable | disable}`	Enable to configure FortiWeb to clear its cache memory every 45 minutes and generate an event log message for the action.	`disable`
`enable-debug-log {enable | disable}`	Enable so that FortiWeb will record crash, daemon, kernel, netstat, and core dump logs.	`enable`
`enable-machine-learning-debug {enable | disable}`	Enable so that FortiWeb will record machine learning debug.	`enable`
`enable-file-upload {enable | disable}`	Enable to upload the debugging file.	`disable`

system snmp community

Use this command to configure the FortiWeb appliance's SNMP agent to belong to an SNMP version 1 or 2c community, and to select which events cause the FortiWeb appliance to generate SNMP traps.

To configure the SNMP agent as a member of a SNMP version 3 community, see "system snmp user" on page 308.

The FortiWeb appliance's simple network management protocol (SNMP) agent allows queries for system information can send traps (alarms or event messages) to the computer that you designate as its SNMP manager. In this way you can use an SNMP manager to monitor the FortiWeb appliance. You can add the IP addresses of up to eight SNMP managers to each community, which designate the destination of traps and which IP addresses are permitted to query the FortiWeb appliance.

An SNMP community is a grouping of equipment for network administration purposes. You must configure your FortiWeb appliance to belong to at least one SNMP community so that community's SNMP managers can query the FortiWeb appliance's system information and receive SNMP traps from the FortiWeb appliance.

You can add up to three SNMP communities. Each community can have a different configuration for queries and traps, and the set of events which trigger a trap. Use SNMP traps to notify the SNMP manager of a wide variety of types of events. Event types range from basic system events, such as high usage of resources, to when an attack type is detected or a specific rule is enforced by a policy.

Before you can use SNMP, you must activate the FortiWeb appliance's SNMP agent and add it as a member of at least one community. For details, see "system snmp sysinfo" on page 306. You must also enable SNMP access on the network interface through which the SNMP manager will connect. For details, see "system interface" on page 281.

On the SNMP manager, you must also verify that the SNMP manager is a member of the community to which the FortiWeb appliance belongs, and compile the necessary Fortinet proprietary management information blocks (MIBs) and Fortinet-supported standard MIBs. For information on MIBs, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system snmp community
   edit <community_index>
      set status {enable | disable}
      set name "<community_str>"
      set events {cpu-high | intf-ip | log-full | mem-low | netlink-down-status |
          netlink-up-status | policy-start | policy-stop | pserver-failed | sys-ha-
          cluster-status-change | sys-ha-member-join | sys-ha-member-leave | sys-mode-
          change | waf-access-attack | waf-amethod-attack | waf-blogin-attack |waf-
          hidden-fields | waf-pvalid-attack | waf-signature-detection | waf-url-access-
          attack | waf-spage-attack}
      set query-v1-port <port_int>
      set query-v1-status {enable | disable}
      set query-v2c-port <port_int>
      set query-v2c-status {enable | disable}
      set trap-v1-lport <port_int>
      set trap-v1-rport <port_int>
      set trap-v1-status {enable | disable}
      set trap-v2c-lport <port_int>
      set trap-v2c-rport <port_int>
      set trap-v2c-status {enable | disable}
      config hosts
         edit <snmp-manager_index>
            set ip {"<manager_ipv4>" | "<manager_ipv6>"}
         next
      end
   next
```

```
end
```

Variable	Description	Default
`<community_index>`	Enter the index number of a community to which the FortiWeb appliance belongs. The valid range is 1–9,999,999,999,999,999,999.	No default.
`status {enable | disable}`	Enable to activate the community. This setting takes effect only if the SNMP agent is enabled. For details, see "system snmp sysinfo" on page 306.	`disable`
`name "<community_str>"`	Enter the name of the SNMP community to which the FortiWeb appliance and at least one SNMP manager belongs. The maximum length is 63 characters. The FortiWeb appliance will not respond to SNMP managers whose query packets do not contain a matching community name. Similarly, trap packets from the FortiWeb appliance will include community name, and an SNMP manager may not accept the trap if its community name does not match.	No default.
`events {cpu-high | intf-ip | log-full | mem-low | netlink-down-status | netlink-up-status | policy-start | policy-stop | pserver-failed | sys-ha-cluster-status-change | sys-ha-member-join | sys-ha-member-leave | sys-mode-change | waf-access-attack | waf-amethod-attack | waf-blogin-attack |waf-hidden-fields | waf-pvalid-attack | waf-signature-detection | waf-url-access-attack | waf-spage-attack}`	Enter one or more of the following SNMP event names in order to cause the FortiWeb appliance to send traps when those events occur. Traps will be sent to the SNMP managers in this community. Also enable traps. • `cpu-high`—CPU usage has exceeded 80%. • `intf-ip`—A network interface's IP address has changed. For details, see "system interface" on page 281. • `log-full`—Local log disk space usage has exceeded 80%. If the space is consumed and a new log message is triggered, the FortiWeb appliance will either drop it or overwrite the oldest log message, depending on your configuration. For details, see "log disk" on page 77. • `mem-low`—Memory (RAM) usage has exceeded 80%. • `netlink-down-status`—A network interface has been brought down (disabled). This could be due to either an administrator changing the network interface's settings, or due to HA executing a failover. • `netlink-up-status`—A network interface has been brought up (enabled).This could be due to either an administrator changing the network interface's settings, or due to HA executing a failover. • `policy-start`—A policy was enabled. For details, see "server-policy policy" on page 136. • `policy-stop`—A policy was disabled. For details, see "server-policy policy" on page 136.	No default.

Variable	Description	Default
	• `pserver-failed`—A server health check has determined that a physical server that is a member of a server farm is now unavailable. For details, see "server-policy policy" on page 136. on page 1. • `sys-ha-cluster-status-change`—HA cluster status was changed. • `sys-ha-member-join`—HA member has joined. • `sys-ha-member-leave`—HA member has left. • `sys-mode-change`—The operation mode was changed. See "system settings" on page 298.	
	• `waf-access-attack`—FortiWeb enforced a page access rule. For details, see "waf page-access-rule" on page 468. • `waf-amethod-attack`—FortiWeb enforced an allowed methods restriction. For details, see "waf web-protection-profile inline-protection" on page 528, "waf web-protection-profile offline-protection" on page 541, and "waf allow-method-exceptions" on page 340. • `waf-blogin-attack`—FortiWeb detected a brute force login attack. For details, see "waf brute-force-login" on page 356. • `waf-hidden-fields`—FortiWeb detected a hidden fields attack. • `waf-pvalid-attack`—FortiWeb enforced an input/parameter validation rule. For details, see "waf parameter-validation-rule" on page 471. • `waf-signature-detection`—FortiWeb enforced a signature rule. For details, see "waf signature" on page 472. • `waf-url-access-attack`—FortiWeb enforced a URL access rule. See "waf url-access url-access-rule" on page 503. • `waf-spage-attack`—FortiWeb enforced a start page rule. See "waf start-pages" on page 498.	
`query-v1-port <port_int>`	Enter the port number on which the FortiWeb appliance will listen for SNMP v1 queries from the SNMP managers of the community. The valid range is 1–65,535.	`161`
`query-v1-status {enable | disable}`	Enable to respond to queries using the SNMP v1 version of the SNMP protocol.	`enable`
`query-v2c-port <port_int>`	Enter the port number on which the FortiWeb appliance will listen for SNMP v2c queries from the SNMP managers of the community. The valid range is 1–65,535.	`161`
`query-v2c-status {enable | disable}`	Enable to respond to queries using the SNMP v2c version of the SNMP protocol.	`enable`

Variable	Description	Default
`trap-v1-lport <port_int>`	Enter the port number that will be the source (also called local) port number for SNMP v1 trap packets. The valid range is 1–65,535.	`162`
`trap-v1-rport <port_int>`	Enter the port number that will be the destination (also called remote) port number for SNMP v1 trap packets. The valid range is 1–65,535.	`162`
`trap-v1-status {enable | disable}`	Enable to send traps using the SNMP v1 version of the SNMP protocol.	`enable`
`trap-v2c-lport <port_int>`	Enter the port number that will be the source (also called local) port number for SNMP v2c trap packets. The valid range is 1–65,535.	`162`
`trap-v2c-rport <port_int>`	Enter the port number that will be the destination (also called remote) port number for SNMP v2c trap packets. The valid range is 1–65,535.	`162`
`trap-v2c-status {enable | disable}`	Enable to send traps using the SNMP v2c version of the SNMP protocol.	`enable`
`<snmp-manager_index>`	Enter the index number of an SNMP manager for the community. The valid range is 1–9,999,999,999,999,999,999.	No default.
`ip {"<manager_ipv4>" | "<manager_ipv6>"}`	Enter the IP address of the SNMP manager that, if traps and/or queries are enabled in this community: • Will receive traps from the FortiWeb appliance • Will be permitted to query the FortiWeb appliance SNMP managers have read-only access. To allow any IP address using this SNMP community name to query the FortiWeb appliance, enter `0.0.0.0`. **Note:** Entering `0.0.0.0` effectively disables traps if there are no other host IP entries, because there is no specific destination for trap packets. If you do not want to disable traps, you must add at least one other entry that specifies the IP address of an SNMP manager.	No default.

Example

For an example, see "system snmp sysinfo" on page 306.

Related topics

- "system snmp sysinfo" on page 306
- "system interface" on page 281
- "server-policy policy" on page 136

system snmp sysinfo

Use this command to enable and configure basic information for the FortiWeb appliance's SNMP agent.

Before you can use SNMP, you must activate the FortiWeb appliance's SNMP agent and add it as a member of at least one community. For details, see "system snmp community" on page 301. You must also enable SNMP access on the network interface through which the SNMP manager will connect. For details, see "system interface" on page 281.

On the SNMP manager, you must also verify that the SNMP manager is a member of the community to which the FortiWeb appliance belongs, and compile the necessary Fortinet proprietary management information blocks (MIBs) and Fortinet-supported standard MIBs. For information on MIBs, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system snmp sysinfo
  set contact-info "<contact_str>"
  set description "<description_str>"
  set location "<location_str>"
  set status {enable | disable}
  set engine-id "<engine-id_str>"
end
```

Variable	Description	Default
`contact-info "<contact_str>"`	Type the contact information for the administrator or other person responsible for this FortiWeb appliance, such as a phone number or name. The contact information can contain only letters (a-z, A-Z), numbers, hyphens (-) and underscores (_). The maximum length is 63 characters.	No default.
`description "<description_str>"`	Type a description of the FortiWeb appliance. The string can contain only letters (a-z, A-Z), numbers, hyphens (-) and underscores (_). The maximum length is 63 characters.	No default.
`location "<location_str>"`	Type the physical location of the FortiWeb appliance. The string can contain only letters (a-z, A-Z), numbers, hyphens (-) and underscores (_). The maximum length is 63 characters.	No default.
`status {enable | disable}`	Enable to activate the SNMP agent, enabling the FortiWeb appliance to send traps and/or receive queries for the communities in which you have enabled queries and/or traps. This setting enables queries only if SNMP administrative access is enabled on one or more network interfaces. For details, see "system interface" on page 281.	`disable`

Variable	Description	Default
`engine-id "<engine-id_str>"`	Enter the SNMP engineID string. The maximum is 24 characters.	No default

Example1234

This example enables the SNMP agent, configures it to belong to a community named public whose SNMP manager is `192.0.2.20`. The SNMP manager is not directly attached, but can be reached through the network interface named port3.

This example also configures the SNMP agent to send traps using SNMP v2c for high CPU or memory usage, and when the primary appliance fails; it also enables responses to SNMP v2c queries through the network interface named port3 (along with the previously enabled administrative access protocols, ICMP ping, HTTPS, and SSH).

```
config system snmp sysinfo
   set contact-info "admin_example_com"
   set description "FortiWeb-1000E"
   set location "Rack_2"
   set status enable
   set engine-id 246
end

config system snmp community
   edit 1
      set status enable
      set name public
      set events cpu-high
      set query-v1-status disable
      set query-v2c-port 161
      set query-v2c-status enable
      set trap-v1-status disable
      set trap-v2c-lport 162
      set trap-v2c-rport 162
      set trap-v2c-status enable
      config hosts
         edit 1
            set interface port3
            set ip 192.0.2.20
         next
      end
   next
end
config system interface
   edit port3
      set allowaccess ping https ssh snmp
   next
end
```

system snmp user

Use this command to configure the FortiWeb appliance's SNMP agent to belong to an SNMP version 3 community, and to select which events cause the FortiWeb appliance to generate SNMP traps.

To configure the SNMP agent as a member of a SNMP version version 1 or 2c community and for more information on the SNMP agent, see "system snmp community" on page 301.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system snmp user
   edit name "<user_str>"
      set status {enable | disable}
      set security-level { noauthnopriv | authnopriv | authpriv >
      set auth-proto {sha1 | md5}
      set auth-pwd "<auth-password_str>"
      set priv-proto {aes | des}
      set priv-pwd "<priv-password_str>"
      set query-status {enable | disable}
      set query-port <port_int>
      set trap-status {enable | disable}
      set trapport-local <port_int>
      set trapport-remote <port_int>
      set trapevent {cpu-high | intf-ip | log-full | mem-low | netlink-down-status |
          netlink-up-status | policy-start | policy-stop | pserver-failed | sys-ha-
          cluster-status-change | sys-ha-member-join | sys-ha-member-leave | sys-mode-
          change | waf-access-attack | waf-amethod-attack | waf-blogin-attack |waf-
          hidden-fields | waf-pvalid-attack | waf-signature-detection | waf-url-access-
          attack | waf-spage-attack}
      set "<snmp-manager_index>"
      config hosts
         edit "<snmp-manager_index>"
            set {"<manager_ipv4> | <manager_ipv6>"}
         next
      end
   next
end
```

Variable	Description	Default
`name "<user_str>"`	Enter the name of the SNMP user to which the FortiWeb appliance and at least one SNMP manager belongs. The maximum length is 63 characters. The FortiWeb appliance does not respond to SNMP managers whose query packets do not contain a matching community name. Similarly, trap packets from the FortiWeb	No default.

Variable	Description	Default
	appliance include the community name, and an SNMP manager may not accept the trap if its community name does not match.	
`status {enable | disable}`	Enable to activate the community. This setting takes effect only if the SNMP agent is enabled. For details, see "system snmp sysinfo" on page 306.	`disable`
`security-level { noauthnopriv | authnopriv | authpriv >`	Enter the security level. • `noauthnopriv`—No additional authentication or encryption compared to SNMP v1 and v2. • `authnopriv`—The SNMP manager needs to provide the password specified in this community configuration. Also specify `auth-proto` and `auth-pwd`. • `authpriv`—Adds both authentication and encryption. Also specify `auth-proto`, `auth-pwd`, `priv-proto`, and `priv-pwd`. Ensure that the SNMP manager and FortiWeb use the same protocols and passwords.	No default.
`auth-proto {sha1 | md5}`	If the `security-level` option includes authentication, specify the authentication protocol.	`sha1`
`auth-pwd "<auth-password_str>"`	If the `security-level` option includes authentication, specify the authentication password.	No default.
`priv-proto {aes | des}`	If the `security-level` option is `authprivuser_name`, specify the encryption protocol.	`aes`
`priv-pwd "<priv-password_str>"`	If the `security-level` option is `authprivuser_name`, specify the encryption password.	No default.
`query-status {enable | disable}`	Enable to respond to queries using the SNMP v3 version of the SNMP protocol.	`enable`
`query-port <port_int>`	Enter the port number on which the FortiWeb appliance listens for SNMP v3 queries from the SNMP managers of the community. The valid range is 1–65,535.	`161`
`trap-status {enable | disable}`	Enable to send traps using the SNMP v3 version of the SNMP protocol.	`enable`
`trapport-local <port_int>`	Enter the port number that is the source (also called local) port number for SNMP v3 trap packets. The valid range is 1–65,535.	`162`
`trapport-remote <port_int>`	Enter the port number that is the destination (also called remote) port number for SNMP v3 trap packets. The valid range is 1–	`162`

Variable	Description	Default
	65,535.	
`trapevent {cpu-high | intf-ip | log-full | mem-low | netlink-down-status | netlink-up-status | policy-start | policy-stop | pserver-failed | sys-ha-cluster-status-change | sys-ha-member-join | sys-ha-member-leave | sys-mode-change | waf-access-attack | waf-amethod-attack | waf-blogin-attack |waf-hidden-fields | waf-pvalid-attack | waf-signature-detection | waf-url-access-attack | waf-spage-attack}`	Enter the name of one or more the SNMP events. When FortiWeb detects the specified events, it sends traps to the SNMP managers in this community. Also enable `trap-status`. • `cpu-high`—CPU usage has exceeded 80%. • `intf-ip`—A network interface's IP address has changed. See "system interface" on page 281. • `log-full`—Local log disk space usage has exceeded 80%. If the space is consumed and a new log message is triggered, the FortiWeb appliance will either drop it or overwrite the oldest log message, depending on your configuration. For details, see "log disk" on page 77. • `mem-low`—Memory (RAM) usage has exceeded 80%. • `netlink-down-status`—A network interface has been brought down (disabled). This could be due to either an administrator changing the network interface's settings, or due to HA executing a failover. • `netlink-up-status`—A network interface has been brought up (enabled). This could be due to either an administrator changing the network interface's settings, or due to HA executing a failover. • `policy-start`—A policy was enabled. For details, see "server-policy policy" on page 136. • `policy-stop`—A policy was disabled. For details, see "server-policy policy" on page 136. • `pserver-failed`—A server health check has determined that a physical server that is a member of a server farm is now unavailable. For details, see "server-policy policy" on page 136. • `sys-ha-cluster-status-change`—HA cluster status was changed. • `sys-ha-member-join`—HA member has joined. • `sys-ha-member-leave`—HA member has left. • `sys-mode-change`—The operation mode was changed. For details, see "system settings" on page 298.	No default.
	• `waf-access-attack`—FortiWeb enforced a page access rule. For details, see "waf page-access-rule" on page 468. • `waf-amethod-attack`—FortiWeb enforced an allowed methods restriction. For details, see "waf web-protection-profile inline-protection" on page 528, "waf web-protection-profile offline-protection" on page 541, and "waf allow-method-exceptions" on page 340.	

Variable	Description	Default
	• `waf-blogin-attack`—FortiWeb detected a brute force login attack. For details, see "waf brute-force-login" on page 356. • `waf-hidden-fields`—FortiWeb detected a hidden fields attack. • `waf-pvalid-attack`—FortiWeb enforced an input/parameter validation rule. For details, see "waf parameter-validation-rule" on page 471. • `waf-signature-detection`—FortiWeb enforced a signature rule. For details, see "waf signature" on page 472. • `waf-url-access-attack`—FortiWeb enforced a URL access rule. For details, see "waf url-access url-access-rule" on page 503. • `waf-spage-attack`—FortiWeb enforced a start page rule. For details, see "waf start-pages" on page 498.	
`"<snmp-manager_index>"`	Enter the index number of an SNMP manager for the community. The valid range is 1–9,999,999,999,999,999,999.	No default.
`{"<manager_ipv4> | <manager_ipv6>"}`	Enter the IP address of the SNMP manager that can do the following when you enable traps, queries, or both in this community: • Receive traps from the FortiWeb appliance • Query the FortiWeb appliance SNMP managers have read-only access. To allow any IP address using this SNMP community name to query the FortiWeb appliance, enter `0.0.0.0` or `::`. **Note:** Entering `0.0.0.0` or `::` effectively disables traps if there are no other host IP entries, because there is no specific destination for trap packets. If you do not want to disable traps, add at least one other entry that specifies the IP address of an SNMP manager.	No default.

Example

For an example, see "system snmp sysinfo" on page 306.

Related topics

- "system snmp sysinfo" on page 306

system tcpdump

Use this command to configure capturing packets.

To use this command, your administrator account's access control profile must have `rw` permission to the `netgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system tcpdump
   edit file id
      set "<filter_str>"
      set {any | "<interface_str>"}
      set "<max-packet-count_int>"

end
```

Variable	Description	Default
`file id`	Enter the packet capture file ID.	No default
`"<max-packet-count_int>"`	Specify the maximum packets you want to capture for the policy. Capture will stop automatically if the total captured packets hit the count.	`4000`
`"<filter_str>"`	Specify which protocols and port numbers that you do or do not want to capture, such as `'tcp and port 80 and host IP1 and ( IP2 or IP3 )'`, or leave this field blank for no filters. **Note** that please use the same filter expression as `tcpdump` for this filter, you can refer to the Linux main page of TCPDUMP (http://www.tcpdump.org/manpages/tcpdump.1.html).	No default.
`{any | "<interface_str>"}`	Select the network interface on which you want to capture packets, such as `port1`, or `any` for all interfaces.	`any`
`"<max-packet-count_int>"`	Specify the maximum packets you want to capture for the policy. Capture will stop automatically if the total captured packets hit the count.	`4000`

Related topics

- "debug" on page 574

system v-zone

Use this command to configure bridged network interfaces, also called v-zones.

Bridges allow network connections to travel through the FortiWeb appliance's physical network ports **without** explicitly connecting to one of its IP addresses.

For FortiWeb-VM, you must create vSwitches **before** you can configure a bridge. For details, see the FortiWeb-VM Install Guide:

https://docs.fortinet.com/fortiweb/hardware

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `netgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config system v-zone
   edit "<bridge_name>"
      set interfaces {"<interface_name>" "<interface_name>" ...}
      set monitor {enable | disable}
      set mtu <mtu_int>
      set use-interface-macs {"<interface_name>" "<interface_name>" ...}
      set multicast-snooping {enable | disable}
   next
end
```

Variable	Description	Default
"<bridge_name>"	Type the name of the bridge. The maximum length is 15 characters. To display the list of existing bridges, type: `edit ?`	No default.
interfaces {"<interface_name>" "<interface_name>" ...}	Type the names of two or more network interfaces that currently have no IP address of their own, nor are members of another bridge, and therefore could be members of this bridge. Separate each name with a space. The maximum length is 63 characters.	No default.
mtu <mtu_int>	Enter the maximum transmission unit (MTU) that the bridge supports. When you specify the MTU for a bridge, FortiWeb automatically sets the MTU for the v-zone members to the same value. Valid values are 512–9216 (for IPv4) or 1280–9216 (for IPv6).	1500

Variable	Description	Default
`multicast-snooping {enable | disable}`	Enable/disable multicast snooping.	No default
`monitor {enable | disable}`	Specifies whether FortiWeb automatically brings down all members of this v-zone if one member goes down.	`disable`
`use-interface-macs {"<interface_name>" "<interface_name>" ...}`	Enter the names of network interfaces that are members of the bridge and send and transmit traffic using the MAC address of their corresponding FortiWeb network interface. When the operation mode is True Transparent Proxy, by default, traffic to the back-end servers preserves the MAC address of the source. If you are using FortiWeb with front-end load balancers that are in a high availability cluster that uses multiple bridges, this mechanism can cause switching problems on failover. When the v-zone uses the MAC address of the FortiWeb network interface instead, a failover does not interrupt the flow of traffic. Available only when the operation mode is True Transparent Proxy.	No default.

Example

This example configures a true bridge between port3 and port4. The bridge has no virtual network interface, and so it cannot respond to pings.

```
config system v-zone
  edit bridge1
    set interfaces port3 port4
  next
end
```

Related topics

- "system interface" on page 281
- "system settings" on page 298

system wccp

Use this command to configure FortiWeb as a Web Cache Communication Protocol (WCCP) client. This configuration allows a FortiGate configured as a WCCP server to redirect HTTP and HTTPS traffic to FortiWeb for inspection.

If your WCCP configuration includes multiple WCCP clients, the WCCP server can balance the traffic load among the clients. In addition, it detects when a client fails and redirects sessions to clients that are still available.

WCCP was originally designed to provide web caching with load balancing and fault tolerance and is described by the Web Cache Communication Protocol Internet draft.

This feature requires the operation mode to be WCCP. For details, see "system settings" on page 298.

For information on connecting and configuring your network devices for WCCP mode, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

For detailed information on configuring FortiGate and other Fortinet devices to act as a WCCP service group, see the FortiGate WCCP topic in the *FortiOS Handbook*:

https://docs.fortinet.com/fortigate/admin-guides

Syntax

```
config system wccp
  edit service-id <service-id_int>
    set cache-id "<cache-id_ipv4>"
    set router-list "<router-list_ipv4>"
    set group-address "<group-address_ipv4>"
    set authentication {enable | disable}
    set password "<passwd_str>"
    set cache-engine-method {GRE | L2}
    set ports <ports_int>
    set primary-hash [src-ip | dst-ip | src-port | dst-port}
    set priority <priority_int>
    set protocol <priority_int>
    set assignment-weight <assignment-weight_int>
    set assignment-bucket-format {ciso-implementation | wccp-v2}
    set return-to-sender {enable | disable}
  end
```

Variable	Description	Default
`service-id <service-id_int>`	Enter the service ID of the WCCP service group that this WCCP client belongs to. For HTTP traffic, the service ID is 0. For other types of traffic (for example, HTTPS), the valid range is 51–255. Do not use 1–50, which are reserved by the WCCP standard.	`51`
`cache-id "<cache-id_ipv4>"`	Enter the IP address of the FortiWeb interface that communicates with the WCCP server. Ensure that the WCCP protocol is enabled for the specified network interface. For details, see "system settings" on page 298.	No default.
`router-list "<router-list_ipv4>"`	Enter the IP addresses of the WCCP servers in the WCCP service group. You can specify up to 8 servers. To configure more than 8 WCCP servers, use Group Address instead.	No default.

Variable	Description	Default
`group-address "<group-address_ipv4>"`	Enter the IP addresses of the clients for multicast WCCP configurations. The multicast address allows you to configure a WCCP service group with more than 8 WCCP clients. The valid range of multicast addresses is 224.0.0.0–239.255.255.255.	No default.
`authentication {enable | disable}`	Specify whether communication between the WCCP server and client is encrypted using the MD5 cryptographic hash function.	`disable`
`password "<passwd_str>"`	Enter the password used by the WCCP server and clients. All servers and clients in the group use the same password. The maximum password length is 8 characters. Available only when `authentication {enable | disable}` (page 316) is `enabled`.	No default.
`cache-engine-method {GRE | L2}`	Enter how the FortiGate unit transmits traffic to FortiWeb: • `GRE`—The WCCP server encapsulates redirected packets within a generic routing encapsulation (GRE) header. The packets also have a WCCP redirect header. • `L2`—The WCCP server overwrites the original MAC header of the IP packets and replaces it with the MAC header for the WCCP client.	`GRE`
`ports <ports_int>`	Enter the port numbers of the sessions that this client inspects. The valid range is 0–65535. Enter 0 to specify all ports.	`80`
`primary-hash [src-ip | dst-ip | src-port | dst-port}`	Enter the hashing scheme that the WCCP server uses in combination with `assignment-weight` to direct traffic, when the WCCP service group has more than one WCCP client. Specify one or more of the following values: • `src-ip`—Source IP address • `dst-ip`—Destination IP address • `src-port`—Source port • `dst-port`—Destination port	`src-ip dst-ip`

Variable	Description	Default
priority <priority_int>	Enter a value that specifies the priority that this service group has. If more than one service group is available to scan the traffic specified by ports and protocol, the WCCP server transmits all the traffic to the service group with the highest priority value.	0
protocol <priority_int>	Enter the protocol of the network traffic the WCCP service group transmits. For TCP sessions, enter 6. Valid values are 0–255.	6
assignment-weight <assignment-weight_int>	Enter a value that the WCCP server uses in combination with primary-hash to direct traffic, when the WCCP service group has more than one WCCP client. The valid range is 0–255.	0
assignment-bucket-format {ciso-implementation | wccp-v2}	Enter the hash table bucket format for the WCCP cache engine. • cisco-implementation—Source IP address • wccp-v2—Web Cache Communication Protocol version 2	ciso-implementation
return-to-sender {enable | disable}	Specify whether FortiWeb routes traffic back to the client instead of the WCCP server.	disable

Example

This example configures FortiWeb as a WCCP client that belongs to the WCCP service group 52 and specifies the interface used for WCCP client functionality (192.0.2.100) and the WCCP server (192.0.2.1).

```
config system wccp
   edit service-id 52
      set cache-id "192.0.2.100"
      set router-list "192.0.2.1"
      set ports 80 443
      set primary-hash src-ip dst-ip
```

user admin-usergrp

Use this command to configure LDAP/RADIUS/PKI/TACACS+ remote authentication groups that can be used when configuring a FortiWeb administrator account.

Before you can add a remote authentication group, you must first define at least one query for LDAP, RADIUS, or TACACS+ accounts (see "user ldap-user" on page 320 or "server-policy custom-application application-policy" on page 1), a PKI user (see "user pki-user" on page 326), or a TACACS+ user (see "user tacacs+ user" on page 331).

For information about certificate-based Web UI login, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `authusergrp` area. For details, see "Permissions" on page 55.

Syntax

```
config user admin-usergrp
   edit "<group_name>"
      config members
         edit <entry_index>
            set type {ldap | radius | pki | tacacs+}
            set ldap-name "<query_name>"
            set radius-name "<query_name>"
            set tacacs+-name "<tacacs+_name>"
         next
      end
   next
end
```

Variable	Description	Default
`"<group_name>"`	Enter the name of the remote authentication group. The maximum length is 63 characters.	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`type {ldap | radius | pki | tacacs+}`	Select the protocol used for the query, LDAP, RADIUS, PKI or TACACS+.	`ldap`
`ldap-name "<query_name>"`	Enter the name of an existing LDAP account query. The maximum length is 63 characters. To display the list of existing queries, enter: `edit ?`	No default.
`radius-name "<query_name>"`	Enter the name of an existing RADIUS account query. The maximum length is 63 characters.	No default.

Variable	Description	Default
	To display the list of existing queries, enter: `edit ?`	
`pki-name "<pki_name>"`	Enter the name of an existing PKI user. The maximum length is 63 characters. To display the list of existing queries, enter: `edit ?`	No default.
`tacacs+-name "<tacacs+_name>"`	Enter the name of an existing TACACS+. The maximum length is 63 characters. To display the list of existing queries, enter: `edit ?`	No default.

Example

This example creates a remote authentication group using an existing LDAP user query named `LDAP Users 1`. Because remote authentication groups use LDAP queries by default, the LDAP query type is not explicitly configured.

```
config user admin-usergrp
   edit "Admin LDAP"
      config members
         edit 0
            set ldap-name "LDAP Users 1"
         next
      end
   next
end
```

user kerberos-user

Use this command to specify a Kerberos Key Distribution Center (KDC) that FortiWeb can use to obtain a Kerberos service ticket for web applications on behalf of clients.

Because FortiWeb determines the KDC to use based on the realm of the web application, you do not have to specify the KDC in the site publish rule.

For details, see "waf site-publish-helper rule" on page 485 and the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `authusergrp` area. For details, see "Permissions" on page 55.

Syntax

```
config user kerberos-user
  edit "<kdc_name>"
    set realm "<realm_str>"
    set server "<kdc-server_ip>"
    set port <kdc-port_int>
    set status <kdc_status>
  next
end
```

Variable	Description	Default
`"<kdc_name>"`	Enter the name of the Key Distribution Center (KDC).	No default.
`realm "<realm_str>"`	Enter the domain of the domain controller (DC) that the Key Distribution Center (KDC) belongs to.	No default.
`server "<kdc-server_ip>"`	Enter the IP address of the KDC. In most cases, the KDC is located on the same server as the DC.	No default.
`port <kdc-port_int>`	Enter the port the KDC uses to listen for requests.	No default.
`status <kdc_status>`	Specify whether the KDC configuration is enabled.	`enable`

user ldap-user

Use this command to configure queries that can be used for remote authentication of either FortiWeb administrators or end users via an LDAP server.

To apply LDAP queries to end users, select a query in a user group that is then selected within an authentication rule, which is in turn selected within an authentication policy, which is ultimately selected within an inline protection profile used for web protection. For details, see "user user-group" on page 332.

To apply LDAP queries to administrators, select a query in an admin group and reference that group in a system administrator configuration. For details, see "user admin-usergrp" on page 318.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `authusergrp` area. For details, see "Permissions" on page 55.

Syntax

```
config user ldap-user
  edit "<ldap-query_name>"
    set bind-type {anonymous | simple | regular}
    set common-name-id "<cn-attribute_str>"
    set distinguished-name "<search-dn_str>"
    set filter "<query-filter_str>"
    set group_authentication {enable | disable}
    set group_dn "<group-dn_str>"
    set group-type {edirectory | open-ldap | windows-ad}
    set password "<bind-password_str>"
    set port <port_int>
    set protocol {ldaps | starttls}
    set server "<ldap_ipv4_domain>"
    set ssl-connection {enable | disable}
    set username "<bind-dn_str>"
  next
end
```

Variable	Description	Default
`"<ldap-query_name>"`	Enter the name of the LDAP user query. The maximum length is 63 characters. To display the list of existing queries, enter: `edit ?`	No default.
`bind-type {anonymous | simple | regular}`	Select one of the following LDAP query binding styles: • `simple`—Bind using the client-supplied password and a bind DN assembled from the `common-name-id "<cn-attribute_str>"` (page 322), `distinguished-name "<search-dn_str>"` (page 322), and the client-supplied user name. • `regular`—Bind using a bind DN and password that you configure in `username "<bind-dn_str>"` (page 323) and `password "<bind-password_str>"` (page 322). • `anonymous`—Do not provide a bind DN or password. Instead, perform the query without authenticating. Select this option only if the LDAP directory supports anonymous	`simple`

Variable	Description	Default
	queries.	
`common-name-id "<cn-attribute_str>"`	Enter the identifier, often `cn`, for the common name (CN) attribute whose value is the user name. The maximum length is 63 characters. Identifiers may vary by your LDAP directory's schema.	No default.
`distinguished-name "<search-dn_str>"`	Enter the distinguished name (DN) such as `ou=People,dc=example,dc=com`, that, when prefixed with the common name, forms the full path in the directory to user account objects. The maximum length is 255 characters.	No default.
`filter "<query-filter_str>"`	Enter an LDAP query filter string, if any, that will be used to filter out results from the query's results based upon any attribute in the record set. The maximum length is 255 characters. This option is valid only when `bind-type {anonymous | simple | regular}` (page 321) is `regular`.	No default.
`group_authentication {enable | disable}`	Enable to only include users that are members of an LDAP group. Also configure `group-type {edirectory | open-ldap | windows-ad}` (page 322) and `group_dn "<group-dn_str>"` (page 322). This option is valid only when `bind-type {anonymous | simple | regular}` (page 321) is `regular`.	`enable`
`group_dn "<group-dn_str>"`	Enter the distinguished name of the LDAP user group, such as `ou=Groups,dc=example,dc=com`. The maximum length is 255 characters. This option is valid only when `group_authentication {enable | disable}` (page 322) is enabled.	No default.
`group-type {edirectory | open-ldap | windows-ad}`	Select the schema that matches your server's LDAP directory. Group membership attributes may have different names depending on an LDAP directory schemas. The FortiWeb appliance will use the group membership attribute that matches your directory's schema when querying the group DN. This option is valid only when `group_authentication {enable | disable}` (page 322) is enabled.	`open-ldap`
`password "<bind-password_str>"`	Enter the password of the `username "<bind-dn_str>"` (page 323). The maximum length is 63 characters.	No default.

Variable	Description	Default
	This field may be optional if your LDAP server does not require the FortiWeb appliance to authenticate when performing queries, and does not appear if `bind-type {anonymous | simple | regular}` (page 321) is `anonymous` or `simple`.	
`port <port_int>`	Enter the port number where the LDAP server listens. The valid range is 1–65535. The default port number varies by your selection in `ssl-connection {enable | disable}` (page 323); port 389 is typically used for non-secure connections or for STARTTLS-secured connections, and port 636 is typically used for SSL-secured (LDAPS) connections.	`389`
`protocol {ldaps | starttls}`	Select whether to secure the LDAP query using LDAPS or STARTTLS. You may need to reconfigure port <port_int> to correspond to the change in protocol. This field is applicable only if `ssl-connection {enable | disable}` (page 323) is `enable`.	`ldaps`
`server "<ldap_ipv4_domain>"`	Type the server IP or domain address of the LDAP server.	`0.0.0.0`
`ssl-connection {enable | disable}`	Enable to connect to the LDAP servers using an encrypted connection, then select the style of the encryption in `protocol {ldaps | starttls}` (page 323).	`enable`
`username "<bind-dn_str>"`	Enter the bind DN, such as `cn=FortiWebA,dc=example,dc=com`, of an LDAP user account with permissions to query the `distinguished-name "<search-dn_str>"` (page 322). The maximum length is 255 characters. This field may be optional if your LDAP server does not require the FortiWeb appliance to authenticate when performing queries, and does not appear if `bind-type {anonymous | simple | regular}` (page 321) is `anonymous` or `simple`.	No default.

Example

This example configures an LDAP user query to the server at `192.0.2.100` on port `389`. SSL and TLS are disabled. To bind the query, the FortiWeb appliance will use the bind DN `cn=Manager,dc=example,dc=com`, whose password is `mySecretPassword`. Once connected and bound, the query for search for user objects in `ou=People,dc=example,dc=com`, comparing the user name supplied by the HTTP client to the value of each object's `cn` attribute. Group authentication is disabled.

```
config user ldap-user
```

```
    edit "ldap-user1"
      set server "192.0.2.100"
      set ssl-connection disable
      set port 389
      set common-name-id "cn"
      set distinguished-name "ou=People,dc=example,dc=com"
      set bind-type regular
      set username "cn=Manager,dc=example,dc=com"
      set password "mySecretPassword"
      set group-authentication disable
    next
end
```

user local-user

Use this command to configure locally defined user accounts.

Local user accounts are used by the HTTP authentication feature to authorize HTTP requests. For details, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To incorporate local user accounts, add them to a user group that is selected within an authentication rule, which is in turn selected within an authentication policy. For details, see "user user-group" on page 332.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `authusergrp` area. For details, see "Permissions" on page 55.

Syntax

```
config user local-user
  edit "<local-user_name>"
    set username "<user_str>"
    set password "<password_str>"
  next
end
```

Variable	Description	Default
"<local-user_name>"	Enter a name that can be referenced in other parts of the configuration. To display the list of existing accounts, enter: `edit ?`	No default.

Variable	Description	Default
	The maximum length is 63 characters. **Note:** This is **not** the user name that the person must provide when logging in to the CLI or web UI.	
`username "<user_str>"`	Enter the user name that the client must provide when logging in, such as `user1` or `user1@example.com`. The maximum length is 63 characters.	No default.
`password "<password_str>"`	Enter the password for the local user account. The maximum length is 63 characters.	No default.

Example

This example configures a local user account that can be used for HTTP authentication.

```
config user local-user
  edit "local-user1"
    set username "user1"
    set password "myPassword"
  next
end
```

Related topics

- "user user-group" on page 332

user ntlm-user

Use this command to configure user accounts that will authenticate with the FortiWeb appliance via an NT LAN Manager (NTLM) server.

NTLM queries can be made to a Microsoft Windows or Active Directory server that has been configured for NTLM authentication. Both NTLM v1 and NTLM v2 versions of the protocol are supported.

NTLM user queries are used by the HTTP authentication feature to authorize HTTP requests. For details, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To incorporate NTLM user account queries, add them to a user group that is selected within an authentication rule, which is in turn selected within an authentication policy. For details, see "user user-group" on page 332.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `authusergrp` area. For details, see "Permissions" on page 55.

Syntax

```
config user ntlm-user
```

```
    edit "<ntlm-query_name>"
       set port <port_int>
       set server "<ntlm_ipv4>"
    next
  end
```

Variable	Description	Default
"<ntlm-query_name>"	Enter the name of the NTLM user query. The maximum length is 63 characters. To display the list of existing queries, enter: `edit ?`	No default.
port <port_int>	Enter the port number where the NTLM server listens. The valid range is 1–65535.	445
server "<ntlm_ipv4>"	Enter the IP address of the NTLM server.	No default.

Example

This example configures an NTLM query connection to a server at 192.0.2.101 on port 445.

```
config user ntlm-user
   edit "ntlm-user1"
      set server "192.0.2.101"
      set port 445
   next
end
```

Related topics

- "user user-group" on page 332

user pki-user

In FortiWeb's certificate-based Web UI login, a PKI user is the administrator that FortiWeb will authorizes his Web UI access based on his PKI certificate. With this command, you can create a PKI user for FortiWeb to verify and authorize the Web UI accesses from the user.

Before creating a PKI user, you must import the CA certificate (through FortiWeb Web UI) associated with the user to the FortiWeb. For details, see "system admin-certificate ca" on page 199.

After the PKI user is created, include it in an admin group through "user admin-usergrp" on page 318.

For information about certificate-based Web UI login, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config user pki-user
   edit "<pki-user_name>"
      set cacert "<cacert_str>"
      set subject "<subject_str>"
   next
end
```

Variable	Description	Default
`"<pki-user_name>"`	Enter the name of a PKI user. The maximum length is 63 characters.	No default.
`cacert "<cacert_str>"`	Specifies the CA certificate associated with the PKI user's certificate. It must be one of the CA certificates stored on the FortiWeb for administration. For details, see "system admin-certificate ca" on page 199.	No default.
`subject "<subject_str>"`	Specifies the subject of the PKI user's certificate, such as `C = US, ST = Washington, O = yourorganization, CN = yourname`.	No default.

Example

This example adds a PKI user associated with the CA certificate `CA_Cert_1`.

```
config user pki-user
   edit "pki_user1"
      set cacert "CA_Cert_1"
      set subject "C = US, ST = Washington, O = oganization, CN = Bradley Avery"
   next
end
```

user radius-user

Use this command to configure RADIUS queries used to authenticate end-users and/or administrators.

If you use a RADIUS query for administrators, separate it from the queries for regular users. **Do not combine administrator and user queries into a single entry.** Failure to separate queries will allow end-users to have administrative access the FortiWeb web UI and CLI.

Remote Authentication and Dial-in User Service (RADIUS) servers provide authentication, authorization, and accounting functions. The FortiWeb authentication feature uses RADIUS user queries to authenticate and authorize HTTP requests. (The HTTP protocol does not support active logouts, and can only passively log out users when their

connection times out. Therefore FortiWeb does **not** fully support RADIUS accounting.) RADIUS authentication with realms (e.g., the person logs in with an account such as admin@example.com) are supported.

To authenticate a user, the FortiWeb appliance sends the user's credentials to RADIUS for authentication. If RADIUS authentication succeeds, the user is successfully authenticated with the FortiWeb appliance. If RADIUS authentication fails, the appliance refuses the connection. To override the default authentication scheme, select a specific authentication protocol or change the default RADIUS port.

To incorporate RADIUS users, they must be in a user group selected within an authentication rule, which is in turn selected within an authentication policy. For details, see "server-policy custom-application application-policy" on page 1.

For access profiles, FortiWeb appliances support RFC 2548 (http://www.ietf.org/rfc/rfc2548.txt) Microsoft Vendor-specific RADIUS Attributes. If you do not want to use them, you can configure them locally instead. For details, see "system accprofile" on page 190.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `authusergrp` area. For details, see "Permissions" on page 55.

Syntax

```
config user radius-user
  edit "<radius-query_name>"
    set secret "<password_str>"
    set server {radius_ipv4 | radius_ipv6 | domain name}
    set server-port <port_int>
    set auth-type {default | chap | ms_chap | ms_chap_v2 | pap}
    set nas-ip "<nas_ipv4>"
    set secondary-secret "<password_str>"
    set secondary-server {radius2_ipv4 | domain name}
    set secondary-server-port <port_int>
  next
end
```

Variable	Description	Default
`"<radius-query_name>"`	Enter a unique name that can be referenced in other parts of the configuration. Do not use spaces or special characters. The maximum length is 63 characters. To display the list of existing queries, enter: `edit ?` **Note:** This is the name of the query only, **not** the administrator or end-user's account name/login, which is defined by either `"<administrator_name>"` (page 194) or `username "<user_str>"` (page 325).	No default.
`secret "<password_str>"`	Enter the RADIUS server secret key for the primary RADIUS server. The primary server secret key should be a maximum of 16	No default.

Variable	Description	Default
	characters in length, but is allowed to be up to 63 characters.	
`server {radius_ipv4 | radius_ipv6 | domain name}`	Enter the IP address or domain name of the RADIUS server to query for users.	No default.
`server-port <port_int>`	Enter the port number where the RADIUS server listens. The valid range is 1–65535.	`1812`
`auth-type {default | chap | ms_chap | ms_chap_v2 | pap}`	Enter the authentication method. The `default` option uses PAP, MS-CHAP-V2, and CHAP, in that order.	`default`
`nas-ip "<nas_ipv4>"`	Enter the NAS IP address and called station ID. For details, see RFC 2548 (http://www.ietf.org/rfc/rfc2548.txt). If you do not enter an IP address, the IP address of the network interface that the FortiWeb appliance uses to communicate with the RADIUS server is applied.	`0.0.0.0`
`secondary-secret "<password_str>"`	Enter the RADIUS server secret key for the secondary RADIUS server. The secondary server secret key should be a maximum of 16 characters in length, but is allowed to be up to 63 characters.	No default.
`secondary-server {radius2_ipv4 | domain name}`	Enter the IP address or domain name of the secondary RADIUS server.	No default.
`secondary-server-port <port_int>`	Enter the port number where the secondary RADIUS server listens. The valid range is 1–65535.	`1812`

Related topics

- "user admin-usergrp" on page 318
- "user user-group" on page 332

user saml-user

Use this command to configure queries that can be used for remote authentication of either FortiWeb administrators or end users via a Security Assertion Markup Language (SAML) server.

To use a SAML server for client authentication, select it in a site publish rule. For details, see "waf site-publish-helper rule" on page 485.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `authusergrp` area. For details, see "Permissions" on page 55.

Syntax

```
config user saml-user
```

```
    edit "<saml_server_name>"
       set entityID "<server_URL>"
       set service-path "<server_URL_path>"
       set slo-bind {post | redirect}
       set slo-path "<slo_URL_path>"
       set sso-bind <post>
       set sso-path "<sso_URL_path>"
    next
end
```

Variable	Description	Default
"<saml_server_name>"	Enter a name that can be referenced by other parts of the configuration. The maximum length is 63 characters.	No default.
entityID "<server_URL>"	Enter the URL for the SAML server. The communications protocol must be HTTPS.	No default.
service-path "<server_URL_path>"	Enter a path for the SAML server at the URL you specified in entityID "<server_URL>" (page 330).	No default.
slo-bind {post | redirect}	Select the binding that the server will use when the service provider initiates a single logout request: • POST—SAML protocol messages are transported via the user's browser in an XHTML document using base64-encoding. • REDIRECT—SAML protocol messages will be carried in the URL of an HTTP GET request. Because the length of URLs is limited, this option is best for shorter messages. If the SAML message contains information that the IDP is not yet aware of, you can sign the message for security purposes.	POST
slo-path "<slo_URL_path>"	Enter a partial URL that the IDP will use to confirm with the service provider that a user has been logged out.	No default.
sso-bind <post>	Select the binding that the server will use to transport the SAML authentication request to the IDP.	POST
sso-path "<sso_URL_path>"	Enter a partial URL that the IDP will use to confirm with the service provider that a user has been authenticated.	No default.

Example

This example configures a SAML server at https://sp.example.com/samlsp. We specify the Service Path, Assertion Consumer Service (ACS), and Single Logout Service (SLS). We use a POST binding for ACS and a REDIRECT binding for SLS.

```
config user saml-user
   edit "saml_example"
      set entityID "https://sp.example.com/samlsp"
```

```
      set service-path "/saml.sso"
      set slo-bind redirect
      set slo-path "/SLO/REDIRECT"
      set sso-bind post
      set sso-path "/SAML2/POST"
    next
  end
```

Related topic

- "waf site-publish-helper rule" on page 485

user tacacs+ user

Use this command to configure TACACS+ queries that can be used for authentication of administrators' access to the web UI or CLI.

To authenticate an administrator, the FortiWeb appliance sends the administrator's credentials to TACACS+ server for authentication. If the TACACS+ server replies to the query with a signal of successful authentication, the client is successfully authenticated with the FortiWeb appliance. If TACACS+ authentication fails or the query returns a negative result, the appliance refuses the connection.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `authusergrp` area. For details, see "Permissions" on page 1.

Syntax

```
config user tacacs+-user
  edit "<tacacs+-user_name>"
    set server {radius_ipv4 | domain name}
    set secret "<password_str>"
    set auth-type {auto | ms_chap | chap | pap | ascii}
  next
end
```

Variable	Description	Default
`"<tacacs+-user_name>"`	Enter a unique name that can be referenced in other parts of the configuration. The maximum length is 63 characters.	No default.
`server {radius_ipv4 | domain name}`	Enter the IP address or domain name of the TACACS+ server.	No default.
`secret "<password_str>"`	Enter the TACACS+ server secret key for the TACACS+ server.	No default.
`auth-type {auto | ms_chap | chap | pap | ascii}`	Select **Auto** to automatically assign an authentication type or select **Specify** to specify a type among MSCHAP, CHAP, PAP, and ASCII.	`Auto`

- "user admin-usergrp" on page 1
- "user user-group" on page 1

user user-group

Use this command to configure user groups.

User groups are used by the HTTP authentication feature to authorize HTTP requests. A group can include a mixture of local user accounts, LDAP, RADIUS, and NTLM user queries.

Before you can configure a user group, you must first configure any local user accounts or user queries that you want to include. For details, see "user local-user" on page 324, "user ldap-user" on page 320, "server-policy custom-application application-policy" on page 1, or "user ntlm-user" on page 325.

To apply user groups, select them in within an authentication rule, which is in turn selected within an authentication policy, which is ultimately selected within an inline protection profile used for web protection. For details, see "waf http-authen http-authen-rule" on page 417.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `authusergrp` area. For details, see "Permissions" on page 55.

Syntax

```
config user user-group
   edit "<user-group_name>"
      set auth-type {basic | digest | NTLM}
      config members
         edit <entry_index>
            set type {ldap | local | ntlm | radius}
            set ldap-name "<query_name>"
            set local-name "<query_name>"
            set ntlm-name "<query_name>"
            set radius-name "<query_name>"
         next
      end
   next
end
```

Variable	Description	Default
`"<user-group_name>"`	Enter the name of the user group. The maximum length is 63 characters. To display the list of existing groups, enter: `edit ?`	No default.
`auth-type {basic | digest | NTLM}`	Select one of the following authentication types:	`basic`

Variable	Description	Default
	• `basic`—This is the original and most compatible authentication scheme for HTTP. However, it is also the least secure as it sends the user name and password unencrypted to the server. • `digest`—Authentication encrypts the password and thus is more secure than the basic authentication. • `NTLM`—Authentication uses a proprietary protocol of Microsoft and is considered to be more secure than basic authentication.	
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`ldap-name "<query_name>"`	Select the name of a LDAP user query. Available if the value of `type {ldap | local | ntlm | radius}` (page 333) is `ldap`. The maximum length is 63 characters.	No default.
`local-name "<query_name>"`	Select the name of a local user account. Available if the value of `type {ldap | local | ntlm | radius}` (page 333) is `local`. The maximum length is 63 characters.	No default.
`ntlm-name "<query_name>"`	Select the name of a NTLM user query. Available if the value of `type {ldap | local | ntlm | radius}` (page 333) is `ntlm`. The maximum length is 63 characters.	No default.
`radius-name "<query_name>"`	Select the name of a RADIUS user query. Available if the value of `type {ldap | local | ntlm | radius}` (page 333) is `radius`. The maximum length is 63 characters.	No default.
`type {ldap | local | ntlm | radius}`	Select which type of user or user query that you want to add to the group. **Note:** You can mix all user types in the group. However, if the authentication rule's `auth-type {basic | digest | NTLM}` (page 332) does not support a given user type, all user accounts of that type will be ignored, effectively disabling them.	`local`

Example

For an example, see "waf http-authen http-authen-policy" on page 414.

Related topics

wad file-filter

Use this command to specify the names of directories and files that you want to exclude from anti-defacement monitoring. Alternatively, you can specify the folders and files you want FortiWeb to monitor and it will exclude any others.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wadgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config wad file-filter
  edit "<wad-file-filter_name>"
    set filter-type {black-file-list | white-file-list}
      edit <entry_index>
        set file-type {directory | regular-file}
        set file-name "<file_str>"
      next
  end
```

Variable	Description	Default
`"<wad-file-filter_name>"`	Enter the name of the file filter you can reference in other parts of the configuration.	No default.
`filter-type {black-file-list | white-file-list}`	Specify the type of filter: • `black-file-list`—A list of files or folders that the anti-defacement feature does not monitor. • `white-file-list`—A list of files or folders that the anti-defacement feature monitors. The feature ignores all other files and folders. FortiWeb still applies criteria in the anti-defacement configuration to these items. For example, if the file size exceeds the maximum, FortiWeb does not monitor it.	No default.

Variable	Description	Default
`<entry_index>`	Enter the index number of the individual entry in the table.	No default.
`file-type {directory | regular-file}`	Specify the type of item to add to the list: • `directory`—A folder or directory path. • `regular-file`—A file.	No default.
`file-name "<file_str>"`	Enter the name of the folder or file to add to the list. Ensure that the name exactly matches the folder or file that you want to specify. If `file-type {directory | regular-file}` (page 335) is `directory`, include the `/` (forward slash). For example, if `file-type` is `directory` and you want to add a folder `abc` that is under the root folder of a website, enter `/abc`. You can restrict the filter condition to a specific file by including file path information in `file-name`. For example, a website contains many files with the name `123.txt`. To specify the instance located in the `abc` folder only, enter `/abc/123.txt`.	No default.

Example

This example creates a filter `video-folder` that excludes the folder `/abc` from anti-defacement monitoring when it is applied to an anti-defacement monitoring configuration.

```
config wad file-filter
   edit "video-folder"
      set filter-type black-file-list
         edit 1
            set file-type directory
            set file-name "/abc"
         next
      end
```

Related topics

- "wad website" on page 335

wad website

Use this command to enable and configure website defacement attack detection and automatic repair.

The FortiWeb appliance monitors the website's files for any changes and folder modifications at specified time intervals. If it detects a change that could indicate a defacement attack, the FortiWeb appliance notifies you, and can quickly react by automatically restoring the website contents to the previous backup revision.

Optionally, you can specify a filter that either defines which files and folders FortiWeb does not scan when it looks for changes (blacklist) or the specific files and folders you want it to monitor (whitelist). For details, see "wad file-filter" on page 334.

FortiWeb automatically backs up website files and creates a revision in the following cases:

- When the FortiWeb appliance initiates monitoring for the first time, the FortiWeb appliance downloads a backup copy of the website's files and stores it as the first revision.
- If the FortiWeb appliance could not successfully connect during a monitor interval, it creates a new revision the next time it re-establishes the connection.

When you intentionally modify the website, you must disable the `monitor` option; otherwise, the FortiWeb appliance sees your changes as a defacement attempt and undoes them.

Backup copies omit files exceeding the file size limit and/or matching the file extensions that you have configured the FortiWeb appliance to omit. For details, see `backup-max-fsize <limit_int>` (page 337) and `backup-skip-ftype "<extensions_str>"` (page 337).

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wadgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config wad website
  edit <entry_index>
    set alert-email "<email-policy_name>"
    set auto {disable | restore | acknowledge}
    set backup-max-fsize <limit_int>
    set backup-skip-ftype "<extensions_str>"
    set connect-type {ftp | smb | ssh}
    set description "<comment_str>"
    set hostname-ip {"<host_ipv4>" | "<host_fqdn>"}
    set interval-other <seconds_int>
    set interval-root <seconds_int>
    set monitor {enable | disable}
    set monitor-depth <folders_int>
    set name "<name_str>"
    set password "<password_str>"
    set port <port_int>
    set share-name "<share_str>"
    set user "<user_str>"
    set web-folder "<path_str>"
    set file-filter "wad-file-filter_name>"
  next
end
```

Variable	Description	Default
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–16.	No default.
`alert-email "<email-policy_name>"`	Enter the name of the email policy that specifies the email address that FortiWeb sends an email to when it detects that the website changed. (See `config log email-policy` (page 79).)The maximum length is 63 characters.	No default.
`auto {disable | restore | acknowledge}`	Enter the action that FortiWeb takes when it detects that the website has changed. • `disable`—FortiWeb takes no action. You can use the web UI to manually restore all or some of the changed files. • `restore`—Restore the website to the previous revision number. • `acknowledge`—Accept changes to the website. **Note**: When you intentionally modify the website, type `acknowledge`. Otherwise, the FortiWeb appliance detects your changes as a defacement attempt and undoes them.	`disable`
`backup-max-fsize <limit_int>`	Enter a file size limit in kilobytes (KB) to indicate which files will be included in the website backup. Files exceeding this size will not be backed up. The valid range is 1–1,048,576 kilobytes. **Note:** Backing up large files can impact performance.	`10240`
`backup-skip-ftype "<extensions_str>"`	Enter zero or more file extensions, such as `iso,avi`, to exclude from the website backup. Separate each file extension with a comma. The maximum length is 512 characters. **Note:** Backing up large files, such as video and audio, can impact performance.	No default.
`connect-type {ftp | smb | ssh}`	Select which protocol to use when connecting to the website in order to monitor its contents and download website backups. For Microsoft Windows-style shares, enter `smb`.	`ftp`
`description "<comment_str>"`	Enter a description or other comment. If the comment is more than one word or contains special characters, surround the comment with double quotes (`"`). The maximum length is 255 characters.	No default.
`hostname-ip {"<host_ipv4>" | "<host_fqdn>"}`	Enter the IP address or fully qualified domain name (FQDN) of the physical server on which the website is hosted.	No default.

Variable	Description	Default
	This will be used when connecting by SSH or FTP to the website to monitor its contents and download backup revisions, and therefore could be different from the real or virtual web host name that may appear in the `Host:` field of HTTP headers.	
`interval-other <seconds_int>`	Enter the amount of time (in seconds) between each monitoring connection from the FortiWeb appliance to the web server. During this connection, the FortiWeb appliance examines the website's subfolders to see if any files have been changed by comparing the files with the latest backup. The valid range is 1–86,400. If any file change is detected, the FortiWeb appliance will download a new backup revision. If you've enabled `auto {disable | restore | acknowledge}` (page 337), the FortiWeb appliance will revert the files to their previous version.	`600`
`interval-root <seconds_int>`	Enter the number of seconds between each monitoring connection from the FortiWeb appliance to the web server. During this connection, the FortiWeb appliance examines `web-folder "<path_str>"` (page 339) (but **not** its subfolders) to see if any files have been changed by comparing the files with the latest backup. The valid range is 1–86,400. If any file change is detected, the FortiWeb appliance will download a new backup revision. If you've enabled `auto {disable | restore | acknowledge}` (page 337), the FortiWeb appliance will revert the files to their previous version.	`60`
`monitor {enable | disable}`	Enable to monitor the website's files for changes, and to download backup revisions that can be used to revert the website to its previous revision if the FortiWeb appliance detects a change attempt.	`enable`
`monitor-depth <folders_int>`	Enter how many folder levels deep to monitor for changes to the website's files. Files in subfolders deeper than this level will not be backed up. The valid range is 1–10.	`5`
`name "<name_str>"`	Enter a name for the website. The maximum length is 63 characters. This name will not be used when monitoring the website, nor will it be referenced in any other part of the configuration, and therefore can be any identifier that is useful to you. It does not need to be the website's FQDN or virtual host	No default.

Variable	Description	Default
	name.	
`password "<password_str>"`	Enter the password for the user name you entered in `user "<user_str>"` (page 339). The maximum length is 63 characters.	No default.
`port <port_int>`	Enter the port number on which the website's physical server listens. The standard port number for FTP is 21; the standard port number for SSH is 22. This is applicable only if `connect-type {ftp | smb | ssh}` (page 337) is `ftp` or `ssh`.	`21`
`share-name "<share_str>"`	Enter the name of the shared folder on the web server. The maximum length is 63 characters. This variable appears only if `connect-type {ftp | smb | ssh}` (page 337) is `smb`.	No default.
`user "<user_str>"`	Enter the user name that the FortiWeb appliance will use to log in to the website's physical server. The maximum length is 63 characters.	No default.
`web-folder "<path_str>"`	Enter the path to the website's folder, such as `public_html`, on the physical server. The path is relative to the initial location when logging in with the user name that you specify in user "<user_str>". The maximum length is 1,023 characters. Available only if the value of `connect-type {ftp | smb | ssh}` (page 337) is `ftp` or `ssh`.	No default.
`file-filter "wad-file-filter_name>"`	Enter the filter that specifies either the files and folders that FortiWeb excludes from anti-defacement monitoring or the specific files and folders to monitor.	No default.

Example

```
config wad website
   edit 1
      set alert-email "email_policy_1"
      set connect-type ssh
      set hostname-ip "192.0.2.10"
      set monitor enable
      set name "www.example.com"
      set password "P@ssword1"
      set port 22
      set user "fortiweb"
      set web-folder "public_html"
      set file-filter "video-folder"
   next
```

```
end
```

waf allow-method-exceptions

Use this command to configure the FortiWeb appliance with combinations of URLs and host names, which are exceptions to HTTP request methods that are generally allowed or denied according to the inline or Offline Protection profile.

While most URL and host name combinations controlled by a profile may require similar HTTP request methods, you may have some that require different methods. Instead of forming separate policies and profiles for those requests, you can configure allowed method exceptions. The exceptions define specific HTTP request methods that are allowed by specific URLs and hosts.

To apply allowed method exceptions, select them within an inline or Offline Protection profile. For details, see "waf web-protection-profile inline-protection" on page 528 or "waf web-protection-profile offline-protection" on page 541.

Before you configure an allowed method exception, if you want to apply it only to HTTP requests for a specific real or virtual host, you must first define the web host in a protected hosts group. For details, see "server-policy allow-hosts" on page 112.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf allow-method-exceptions
   edit "<method-exception_name>"
      config allow-method-exception-list
         edit <entry_index>
            set allow-request {get post head options trace connect delete put patch
                webdav rpc others}
            set host "<protected-hosts_name>"
            set host-status {enable | disable}
            set request-file "<url_str>"
            set request-type {plain | regular}
         next
      end
   next
end
```

Variable	Description	Default
"<method-exception_name>"	Enter the name of the allowed methods exception. The maximum length is 63 characters.	No default.

Variable	Description	Default
	To display a list of the existing exceptions, enter: `edit ?`	
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`allow-request {get post head options trace connect delete put patch webdav rpc others}`	Select one or more of the allowed HTTP request methods that are an exception for that combination of URL and host. Methods that you do not select will be denied. The **OTHERS** option includes methods not specifically named in the other options. It often may be required by WebDAV applications such as Microsoft Exchange Server and Subversion, which may require HTTP methods not commonly used by web browsers, such as `PROPFIND` and `BCOPY`. For details, see RFC 4918 (http://tools.ietf.org/html/rfc4918). **Note:** If a **WAF Auto Learning Profile** will be selected in the policy with an Offline Protection profile that uses this allowed method exception, you must enable the HTTP request methods that will be used by sessions that you want the FortiWeb appliance to learn about. If a method is disabled, the FortiWeb appliance will reset the connection, and therefore cannot learn about the session.	No default.
`host "<protected-hosts_name>"`	Enter the name of a protected host that the `Host:` field of an HTTP request must be in order to match the exception. The maximum length is 255 characters. This setting is used only if `host-status {enable | disable}` (page 341) is `enable`.	No default.
`host-status {enable | disable}`	Enable to require that the `Host:` field of the HTTP request match a protected hosts entry in order to match the allowed method exception. Also configure `host "<protected-hosts_name>"` (page 341).	`disable`
`request-file "<url_str>"`	Depending on your selection in `request-type {plain | regular}` (page 342), either: • Enter the literal URL, such as `/index.php`, that is an exception to the generally allowed HTTP request methods. The URL must begin with a slash (/). • Enter a regular expression, such as `^/*.php`, matching all and only the URLs which are exceptions to the generally allowed HTTP request methods. The pattern is **not**	No default.

Variable	Description	Default
	required to begin with a slash (/). However, it must at least match URLs that begin with a slash, such as `/index.cfm`. For example, if multiple URLs on a host have identical HTTP request method requirements, you would type a regular expression matching all of and only those URLs. Do not include the name of the web host, such as `www.example.com`, which is configured separately in `host "<protected-hosts_name>"` (page 341). The maximum length is 255 characters. **Note:** Regular expressions beginning with an exclamation point (`!`) are not supported. For information on language and regular expression matching, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides	
`request-type {plain | regular}`	Indicate whether `request-file "<url_str>"` (page 341) is a literal URL (`plain`) or a regular expression (`regular`).	`plain`

Example

This example adds an exception to the list of allowed methods (`post`) that can be used in HTTP requests. In addition to the allowed methods already specified in protection profiles that use this exception, web hosts included in the protected hosts group named `example_com_hosts` (such as `example.com`, `www.example.com`, and `192.0.2.10`) are allowed to receive POST requests to the Perl file that handles the guestbook.

```
config waf allow-method-exceptions
   edit "auto-learn-profile2"
      config allow-method-exception-list
         edit 1
            set allow-request post
            set host "example_com_hosts"
            set host-status enable
            set request-file "/perl/guesbook.pl"
            set request-type plain
         next
      end
   next
end
```

waf allow-method-policy

Use this command to allow only specific HTTP request methods.

To define specific exceptions to this policy, use `config waf allow-method-exceptions` (page 340).

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf allow-method-policy
   edit "<allowed-methods_name>"
      set allow-method {get post head options trace connect delete put patch webdav rpc}
      set severity {High | Medium | Low | Info}
      set triggered-action "<trigger-policy_name>"
      set allow-method-exception "<method-exception_name>"
   next
end
```

Variable	Description	Default
`"<allowed-methods_name>"`	Enter the name of a new or existing allowed methods policy. This field cannot be modified if you are editing an existing allowed method exception. To modify the name, delete the entry, then recreate it using the new name. The maximum length is 63 characters. To display a list of the existing policies, enter: `edit ?`	No default.
`allow-method {get post head options trace connect delete put patch webdav rpc}`	Select one or more HTTP request methods that you want to allow for this specific policy. Methods that you do not select will be denied, unless specifically allowed for a host and/or URL in `analyzer-policy "<fortianalyzer-policy_name>"` (page 106). The `others` option includes methods not specifically named in the other options. It often may be required by WebDAV applications such as Microsoft Exchange Server 2003 and Subversion, which may require HTTP methods not commonly used by web browsers, such as `PROPFIND` and `BCOPY`. For details, see RFC 2518 (http://tools.ietf.org/html/rfc4918). **Note:** If a **WAF Auto Learning Profile** is used in the server policy where the HTTP request method is applied (via the **Web Protection Profile**), you must enable the HTTP request methods that will be used by sessions that you want the FortiWeb appliance to learn about. If a method is disabled, the	No default.

Variable	Description	Default
	FortiWeb appliance will reset the connection, and therefore cannot learn about the session.	
`severity {High | Medium | Low | Info}`	Select the severity level to use in logs and reports generated when a violation of the policy occurs.	`High`
`triggered-action "<trigger-policy_name>"`	Enter the name of the trigger policy you want FortiWeb to apply when a violation of the HTTP request method policy occurs. Trigger policies determine who will be notified by email when the policy violation occurs, and whether the log message associated with the violation are recorded. The maximum length is 63 characters. To display a list of the existing policies, enter: `set triggered-action ?`	No default.
`allow-method-exception "<method-exception_ name>"`	Enter the name of an existing HTTP request method exception, if any, to apply to it. The maximum length is 63 characters. To display a list of the existing policy, enter: `set allow-method-exception ?`	No default.

Example

This example allows the HTTP `GET` and `POST` methods and rejects others, except according to the exceptions defined in `MethodExceptions1`.

```
config waf allow-method-policy
   edit "allowpolicy1"
      set allow-method get post
      set triggered-action "TriggerActionPolicy1"
      set allow-method-exception "MethodExceptions1"
   next
end
```

waf application-layer-dos-prevention

Use this command to create an HTTP-layer DoS protection policy. Once you create the policy, reference it in an inline protection profile that is used by a server policy.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf application-layer-dos-prevention
   edit "<app-dos-policy_name>"
      set enable-http-session-based-prevention {enable | disable}
      set http-connection-flood-check-rule "<rule_name>"
      set http-request-flood-prevention-rule "<rule_name>"
      set enable-layer4-dos-prevention {enable | disable}
      set layer4-access-limit-rule "<rule_name>"
      set layer4-connection-flood-check-rule "<rule_name>"
   next
end
```

Variable	Description	Default
"<app-dos-policy_name>"	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.
enable-http-session-based-prevention {enable | disable}	Enable to use DoS protection based on session cookies. Also configure http-connection-flood-check-rule "<rule_name>" (page 345) and http-request-flood-prevention-rule "<rule_name>" (page 345).	disable
http-connection-flood-check-rule "<rule_name>"	Enter the name of an existing rule that sets the maximum number of HTTP requests per second to a specific URL. The maximum length is 63 characters. To display a list of the existing rules, enter: `set http-connection-flood-check-rule ?` This setting applies only if enable-http-session-based-prevention {enable | disable} (page 345) is enabled.	No default.
http-request-flood-prevention-rule "<rule_name>"	Enter the name of an existing rule that limits TCP connections from the same client. The maximum length is 63 characters. To display a list of the existing rules, enter: `set http-request-flood-prevention-rule ?` This setting applies only if enable-http-session-based-prevention {enable | disable} (page 345) is enabled.	No default.
enable-layer4-dos-prevention {enable | disable}	Enable to use DoS protection that is **not** based on session cookies. Also configure layer4-access-limit-rule "<rule_name>" (page 346) and layer4-connection-	disable

Variable	Description	Default
	`flood-check-rule "<rule_name>"` (page 346).	
`layer4-access-limit-rule "<rule_name>"`	Enter the name of a rule that limits the number of HTTP requests per second from any source IP address. The maximum length is 63 characters. To display a list of the existing rules, enter: `set layer4-access-limit-rule ?` This setting applies only if `enable-layer4-dos-prevention {enable | disable}` (page 345) is enabled.	No default.
`layer4-connection-flood-check-rule "<rule_name>"`	Enter the name of an existing rule that limits the number of TCP connections from the same source IP address. The maximum length is 63 characters. To display a list of the existing rules, enter: `set layer4-connection-flood-check-rule ?` This setting applies only if `enable-layer4-dos-prevention {enable | disable}` (page 345) is enabled.	No default.

Example

This example shows the settings for a DoS protection policy that protects a web portal using existing DoS prevention rules.

```
config waf application-layer-dos-prevention
   edit "Web Portal DoS Policy"
         set enable-http-session-based-prevention enable
         set http-connection-flood-check-rule "Web Portal TCP Connect Limit"
         set http-request-flood-prevention-rule "Web Portal HTTP Request Limit"
         set enable-layer4-dos-prevention enable
         set layer4-access-limit-rule "Web Portal HTTP Request Limit"
         set layer4-connection-flood-check-rule "Web Portal Network Connect Limit"
   next
end
```

waf base-signature-disable

Use this command to disable individual or whole categories of data leak and attack signatures in every signature group that currently exists.

For example, if you disable a certain signature ID with this command, the signature ID in every signature group you have defined will be disabled.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf base-signature-disable
   edit "<signature-ID_name>"
   next
end
```

Variable	Description	Default
`"<signature-ID_name>"`	Enter the name of an individual signature or signature category ID. The maximum length is 63 characters. For example, to disable the first cross-site scripting attack signature everywhere it is currently selected, you would enter: `edit 010000001`	No default.

Example

This example globally disables the XSS signature whose ID is 010000001.

```
config waf base-signature-disable
   edit "010000001"
   next
end
```

Related topics

- "waf signature" on page 472

waf bot-detection-policy

Use this command to edit bot detection policies.

Syntax

```
config waf bot-detection-policy
   edit <bot-detection-policy_ID>
      set policy-id <server-policy-id>
```

```
        set model-status {enable | disable}
        set advanced-mode {enable | disable}
        set client-identification-method {IP | IP-and-User-Agent | Cookie}
        set sampling-count <integer>
        set sampling-count-per-client <integer>
        set sampling-time-per-vector <integer>
        set training-accuracy <percentage>
        set cross-validation <percentage>
        set testing-accuracy <percentage>
        set selected-model {Strict | Loose}
        set anomaly-count <integer>
        set bot-confirmation {enable | disable}
        set verification-method {Real-Browser-Enforement | Captcha-Enforcement}
        set validation-timeout <integer>
        set max-attempt-times <integer>
        set auto-refresh {enable | disable}
        set refresh-factor <value-from-0-to-one>
        set minimum-vector-number <integer>
        set action {alert | deny_no_log | alert_deny | block-period}
        set block-period <integer>
        set severity {High | Medium | Low | Info}
        set trigger <trigger_policy_name>
        config allow-source-ip
           edit <allow-source-ip-list-id>
              set ip <ip-address>
           next
        end
        config bot-detection-exception-list
           edit <bot-detection-exception-list-id>
              set host <string>
              set host-status {enable | disable}
              set url-type {plain | regular}
              set url-pattern <string>
           next
        end
     next
  end
```

Variable	Description	Default
`policy-id <server-policy-id>`	Associate this bot detection policy with the specified server policy.	No defalut
`model-status {enable | disable}`	Enable or disable bot detection.	enable
`advanced-mode {enable | disable}`	Enable or disable the advanced settings in the bot detection policy	disable
`client-identification-method {IP | IP-and-User-Agent | Cookie}`	The data collected in one sample should be from the same user. The system uses **IP**, **IP and User-Agent**, or **Cookie** to identify a user. **IP**: The traffic data in one sample should come	IP-and-User-Agent

Variable	Description	Default
	from the same source IP. **IP and User-Agent**: The traffic data in one sample should come from the same source IP and User-Agent (the browser). **Cookie**: The traffic data in one sample should have the same cookie value.	
`sampling-count <integer>`	This controls how many samples should be collected during the sample collection period. More samples mean the model will be more accurate; but at the same time, it costs longer time to complete the sample collection. Not all traffic data will be collected as samples. The system abandons traffic data if it meets one of the following criteria: • The system sends Javascript challenge to user clients before collecting samples from them. If a client doesn't pass the challenge, the system will not collect sample data from it. • The traffic is from malicious IPs reported by the IP Intelligence feature, or is recognized as a bot by the system. • The traffic is from Known Engines, such as Google and Bing. The system also skips the known engine traffic when executing bot detection. Using these criteria is to exclude malicious traffic and the traffic from known engines that act like a bot, thus to make sure the bot detection model is built upon valid data collected from regular users.	1000
`sampling-count-per-client <integer>`	This controls how many samples FortiWeb will collect from each client (user) in an hour. For example, if the value is set to 3, and a client generates 10 samples in an hour, the system only collects the first 3 samples from this client in an hour. If the client generates more samples in the second hour, the system continues collecting samples from this client until the sample count reaches 3. This option prevents the system from continuously collecting samples from one client,	3

Variable	Description	Default
	thus to avoid the interference of the bot traffic in the sampling stage.	
`sampling-time-per-vector <integer>`	Each vector (also called sample) records a certain user's behaviors in a certain time range. This option defines how long the time range is. For example, if the **Sample Time Per Vector** is 5 minutes, the system will record a certain user's behaviors in 5 minutes and count it as one sample.	5
`training-accuracy <userdef>`	The training accuracy is calculated by this formula: **The number of the regular samples in the training sample set/the total number of training samples * 100%**. As we have introduced in the Basic Concepts section, multiple models are built based on multiple parameter combinations in the SVM algorithm. The system uses each model to detect anomalies in the sample set, and calculates the training accuracy for each model. For example, if there are 100 training samples, and 90 of them are treated as regular samples by a model, then the training accuracy for this model is 90%. The default value for the training accuracy is 95%, which means only the models whose training accuracy equals to or higher than 95% will be selected as qualified models.	95%
`cross-validation <userdef>`	The system divides the training sample sets evenly into three parts, let's say, Part A, B and C. The system executes three rounds of bot detection: • First, the system observes the samples in Part A and B to build up a mathematical model, then uses this model to detect anomalies in Part C. • Then, the system observes the samples in Part B and C to build up a mathematical model, then uses this model to detect anomalies in Part A. • At last, the system observes the samples in Part A and C to build up a mathematical model, then uses this model to detect anomalies in Part B.	90%

Variable	Description	Default
	The cross-validation value is calculated by this formula: **The total number of the regular samples/the total number of samples * 100%.** For example, if there are 100 samples, and 10 anomalies are detected in the three rounds, then the cross-validation value for this model is: (100-10)/100 * 100% = 90%. The default value for the training accuracy is 90%, which means only the models whose Cross-Validation Value equals to or higher than 90% will be selected as qualified models.	
`testing-accuracy <userdef>`	Three quarters of the samples are divided into training sample set, and one quarter of the samples are divided into testing sample set. The system uses the models built for the training sample set to detect anomalies in the testing sample set. If the training accuracy and testing accuracy for a model vary greatly, it may indicate the model is not invalid. The testing accuracy is calculated by this formula: **The number of the regular samples in the testing sample set/the number of the testing samples * 100%.** For example, if there are 100 testing samples, and 95 of them are treated as regular samples by a model, then the testing accuracy for this model is 95%. The default value for the training accuracy is 95%, which means only the models whose testing accuracy equals to or higher than 95% will be selected as qualified models.	95%
`selected-model {Strict | Loose}`	Multiple models are built during the model building stage. The system uses training accuracy, cross-validation value, and testing accuracy to select qualified models. The **Model Type** is used to select the one final model out of all the qualified models. • If you configure the Model Type to **Loose**, the	loose

Variable	Description	Default
	system chooses the model which has the **highest** training accuracy among all the qualified models. • If you configure the Model Type to **Strict**, the system chooses the model which has the **lowest** training accuracy among all the qualified models. The Strict Model detects more anomalies, but there are chances that regular users are false positively detected as bots. The Moderate Model is comparatively loose. It's less likely to conduct false positive detection, but there are risks that real bots might be escaped from detection. There isn't a perfect option for every situation. Whichever model type you choose, you can always leverage the other commands to mitigate the side effects, for example, using `bot-confirmation enable` to avoid false positive detections.	
`anomaly-count <integer>`	If the system detects certain times of anomalies from a user, it takes actions such as sending alerting emails or blocking the traffic from this user. **Anomaly Count** controls how many times of anomalies are allowed for each user. For example, the Anomaly Count is set to 4, and the system has detected 3 anomalies in the last 6 vectors. If the 7th vector is detected again as an anomaly, the system will take actions. Please note that if no valid traffic is collected for the 7th vector (for example, the user leaves your application), the system will clear the anomaly count and the user information. If the user revisits your application, he/she will be treated as new users and the system starts anomaly counting afresh. Since this option allows certain times of anomalies from a user, it might be a good choice if you want to avoid false positive detections.	3
`bot-confirmation {enable | disable}`	If the number of anomalies from a user has reached the **Anomaly Count**, the system executes **Bot Confirmation** before taking	enable

Variable	Description	Default
	actions. The **Bot Confirmation** is to confirm if the user is indeed a bot. The system sends RBE (Real Browser Enforcement) JavaScript or CAPTCHA to the client to double check if it's a real bot.	
`verification-method {Real-Browser-Enforement | Captcha-Enforcement}`	**Real-Browser-Enforcement**: The system sends a JavaScript to the client to test whether it is a web browser or automated tool. **CAPTCHA-Enforcement**: The system requires clients to successfully fulfill a CAPTCHA request.	Real-Browser-Enforement
`validation-timeout <integer>`	Enter the maximum amount of time (in seconds) that FortiWeb waits for results from the client for Bot Confirmation. The default value is 20. The valid range is 5–30.	20
`max-attempt-times <integer>`	The maximum number of the CAPTCHA enforcement validation attempts. If the client fails the validation for the specified time, the system will block the requests from this client. This is only available if the verification-method is set to CAPTCHA-Enforcement	3
`auto-refresh {enable | disable}`	If this is enabled, FortiWeb detects if the current model is applicable. If not, FortiWeb will refresh the current model automatically.	enable
`refresh-factor <userdef>`	Auto Refresh Factor controls the timing to trigger the model refreshment when a certain number of false positive vectors are detected. FortiWeb makes statistics for the bot detection in the past 24 hours. It counts the number of the following vectors: • All vectors in the past 24 hours (A), • Anomaly vectors (B), and • The anomaly vectors that are confirmed as bots (C) If **(B - C)/(A - C) > 1 - Auto Refresh Factor * training accuracy**, the model will be refreshed. • **(B - C)** is the false positive vectors, and **(A - C)** is the regular vectors. **(B - C)/(A - C)** represents the	0.7

<table>
<tr><th>Variable</th><th>Description</th><th>Default</th></tr>
<tr><td></td><td>false positive rate.
• (1 - Auto Refresh Factor * training accuracy) is an adjusted anomaly vector rate. You can consider it as an auto refresh threshold.

If the false positive rate (B - C)/(A - C) becomes greater than the auto refresh threshold (1 - Auto Refresh Factor * training accuracy), the system determines the current model is not applicable and automatically refreshes the model.

The following table calculates the value of the auto refresh threshold when the Auto Refresh Factor is set to 0-1 (assuming the training accuracy is the default value 95%).

For example, if the Auto Refresh Factor is set to 0.8, the auto refresh threshold will be 1 - 0.8 * 95% = 0.24, which means the system automatically refreshes the model when the false positive rate is greater than 0.24 (e.g. 24 false positive vectors and 100 regular vectors).

You can use this table to quickly decide a value for the Auto Refresh Factor that is suitable for your situation.

<table>
<tr><th>Auto Refresh Factor</th><th>Auto Refresh Threshold
1 - Auto Refresh Factor * training accuracy
*Assuming the training accuracy is the default value 95%.</th></tr>
<tr><td>0</td><td>1</td></tr>
<tr><td>0.1</td><td>0.905</td></tr>
<tr><td>0.2</td><td>0.81</td></tr>
<tr><td>0.3</td><td>0.715</td></tr>
<tr><td>0.4</td><td>0.62</td></tr>
<tr><td>0.5</td><td>0.525</td></tr>
<tr><td>0.6</td><td>0.43</td></tr>
<tr><td>0.7</td><td>0.335</td></tr>
<tr><td>0.8</td><td>0.24</td></tr>
<tr><td>0.9</td><td>0.145</td></tr>
<tr><td>1</td><td>0.05</td></tr>
</table></td><td></td></tr>
<tr><td><code>minimum-vector-number <integer></code></td><td>As we mentioned above, the system decides whether to update the bot detection model based on the statistics in the past 24 hours. If very few vectors are detected in the past 24 hours, it may interfere the rightness of the model refreshment decision.

Set a value for the Minimum Vector Number, so that the system won't update the model if the number of the vectors hasn't reached this value.</td><td>0</td></tr>
</table>

Variable	Description	Default
	If the value is set to 0, the system will use the value of the **Sample Count** as the Minimum Vector Number.	
`action {alert | deny_no_log | alert_deny | block-period}`	The action FortiWeb takes when a user client is confirmed as a bot: • alert—Accepts the connection and generates an alert email and/or log message. • deny_no_log—Blocks the request. No logs will be generated. • alert_deny—Blocks the request (or resets the connection) and generates an alert and/or log message. • block-period—Blocks the request for a certain period of time.	alert
`block-period <integer>`	Enter the number of seconds that you want to block the requests. The valid range is 1–3,600 seconds. The default value is 60 seconds. This option only takes effect when you choose **Period Block** in **Action**.	60 seconds
`severity {High | Medium | Low | Info}`	Select the severity level for this anomaly type. The severity level will be displayed in the alert email and/or log message.	High
`trigger <trigger-policy-name>`	Select a trigger policy. If an anomaly is detected, it will trigger the system to send email and/or log messages according to the trigger policy.	No defalut
`<ip-address>`	If specified, the system will collect sample data only from the these IP addresses.	No defalut
`host <string>`	The system collects samples from any IP address except the specified IP address or FQDN of a protected host.	No defalut
`host-status {enable | disable}`	Enable or disable comparing the URLs to the `Host:` field in the HTTP header.	enable
`url-type {plain | regular}`	Specify whether the Exception URLs must contain either: • **plain**—The field is a string that the Exception URL must match exactly.	No defalut

Variable	Description	Default
	• **regular**—The field is a regular expression that defines a set of matching URLs.	
`url-pattern <string>`	Depending on the `url-type`, enter either: • **plain**—The literal URL, such as `/index.php`, that the HTTP request must contain in order to match the rule. The URL must begin with a slash (`/`). • **regular**—A regular expression, such as `^/*.php`, matching the URLs to which the rule should apply. The pattern does not require a slash (`/`), but it must match URLs that begin with a slash, such as `/index.cfm`. Do not include the domain name, such as `www.example.com`, which is configured separately in `[bot-detection-exception-list] <No.> host <string>`.	No defalut

waf brute-force-login

Use this command to configure brute force login attack sensors.

Brute force attacks attempt to penetrate systems by the sheer number of clients, attempts, or computational power, rather than by intelligent insight. For example, in brute force attacks on authentication, multiple web clients may rapidly try one user name and password combination after another in an attempt to eventually guess a correct login and gain access to the system. In this way, behavior differs from web crawlers, which typically do not focus on a single URL.

Brute force login attack sensors track the rate at which each source IP address makes requests for specific URLs. If the source IP address exceeds the threshold, the FortiWeb appliance penalizes the source IP address by blocking additional requests for the time period that you indicate in the sensor.

To apply a brute force login attack sensor, select it within an inline protection profile. For details, see "waf web-protection-profile inline-protection" on page 528.

You can use SNMP traps to notify you when a brute force login attack is detected. For details, see "system snmp community" on page 301.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf brute-force-login
  edit "<brute-force-login_name>"
    config login-page-list
      edit <entry_index>
        set severity {High | Medium | Low | Info}
        set trigger "<trigger-policy_name>"
```

```
            set access-limit-standalone-ip "<rate_int>"
            set access-limit-share-ip "<rate_int>"
            set block-period "<seconds_int>"
            set host "<allowed-hosts_name>"
            set host-status {enable | disable}
            set request-file "<url_str>"
            set ip-port-enable {enable | disable}
          next
        end
      next
    end
```

Variable	Description	Default
"<brute-force-login_name>"	Enter the name of a new or existing brute force login attack sensor. The maximum length is 63 characters. To display a list of the existing sensor, enter: `edit ?`	No default.
severity {High | Medium | Low | Info}	Select the severity level to use in logs and reports generated when a violation of the rule occurs.	High
trigger "<trigger-policy_name>"	Enter the name of the trigger to apply when this policy is violated. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
access-limit-standalone-ip "<rate_int>"	Enter the rate threshold for source IP addresses that are single clients. Request rates exceeding the threshold will cause the FortiWeb appliance to block additional requests for the length of the time in `block-period "<seconds_int>"` (page 358). The valid range is 1–10000. To disable the rate limit, enter `0`.	1
access-limit-share-ip "<rate_int>"	Enter the rate threshold for source IP addresses that are shared by multiple clients behind a network address translation (NAT) device such as a firewall or router. Request rates exceeding the threshold will cause the FortiWeb appliance to block additional requests for the length of the time in the `block-period "<seconds_int>"` (page 358). The valid range is 1–10000. To disable the rate limit, enter `0`. **Note:** Blocking a shared source IP address could block	1

Variable	Description	Default
	innocent clients that share the same source IP address with an offending client. In addition, the rate is a total rate for all clients that use the same source IP address. For these reasons, you should usually enter a greater value for this field than for `access-limit-share-ip "<rate_int>"` (page 357).	
`block-period "<seconds_int>"`	Enter the length of time for which the FortiWeb appliance will block additional requests after a source IP address exceeds a rate threshold. The block period is shared by all clients whose traffic originates from the source IP address. The valid range is from 1 to 10,000 seconds.	`60`
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`host "<allowed-hosts_name>"`	Enter the name of a protected host that the `Host:` field of an HTTP request must be in order to match the sensor. The maximum length is 255 characters. This setting is applied only if `host-status {enable | disable}` (page 358) is `enable`.	No default.
`host-status {enable | disable}`	Enable to require that the `Host:` field of the HTTP request match a protected hosts entry in order to be included in the brute force login attack sensor's rate calculations. Also configure `host "<allowed-hosts_name>"` (page 358).	`disable`
`ip-port-enable {enable | disable}`	Enable to apply the limit of login attempts specified by `access-limit-standalone-ip` or `access-limit-share-ip` per TCP/IP session. When the value is `disable`, the limit is applied per source IP. **Tip:** If you need to cover both possibilities, create two members.	`disable`
`request-file "<url_str>"`	Enter the literal URL, such as `/login.php`, that the HTTP request must match to be included in the brute force login attack sensor's rate calculations. The URL must begin with a slash (/). Do not include the name of the web host, such as `www.example.com`, which is configured separately in `host "<allowed-hosts_name>"` (page 358). The maximum length is 255	No default.

Variable	Description	Default
	characters.	
`ip-port-enable {enable | disable}`		

Example

This example limits IP addresses of individual HTTP clients to 3 requests per second, and NAT IP addresses to 20 requests per second, when they request the file login.php on the host www.example.com on TCP port `8080`.

```
config waf brute-force-login
   edit "brute_force_attack_sensor"
      config login-page-list
         edit 1
            set host "www.example.com:8080"
            set host-status enable
            set request-file "/login.php"
            set access-limit-share-ip 20
            set access-limit-standalone-ip 3
            set block-period 120
         next
      end
   next
end
```

waf cookie-security

Use this command to configure FortiWeb features that prevent cookie-based attacks.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf cookie-security
   edit "<cookie-security_name>"
      set security-mode {no |encrypted | signed}
      set action {alert |alert_deny | block-period | remove_cookie | deny_no_log}
      set block-period <block-period_int>
      set severity {High |Medium | Low | Info}
      set  trigger "trigger-policy_name>"
      set cookie-replay-protection-type {no | IP}
```

```
        set max-age <max-age_int>
        set secure-cookie {enable | disable}
        set http-only {enable | disable}
        set allow-suspicious-cookies{Never |Always | Custom}
        set allow-time "<time_str>"
        config cookie-security-exception-list
           edit <entry_index>
              set cookie-name "<cookie-name_str>"
              set cookie-domain "<cookie-domain_str>"
              set cookie-path "<cookie-path_str>"
        end
     next
  end
```

Variable	Description	Default
"<cookie-security_name>"	Enter the cookie security policy name. The maximum length is 63 characters.	No default.
security-mode {no |encrypted | signed}	Enter the security mode for the cookie security policy • no—FortiWeb does not apply cookie tampering protection or encrypt cookie values. • encrypted—Encrypts cookie values the back-end web server sends to clients. Clients see encrypted cookies only. FortiWeb decrypts cookies submitted by clients before it sends them to the back-end server. • signed—Prevents tampering (cookie poisoning) by tracking the cookie value. This option requires you to enable Session Management in the protection policy and the client to support cookies. For details, see "waf web-protection-profile inline-protection" on page 528. When FortiWeb receives the first HTTP or HTTPS request from a client, it uses a cookie to track the session. When you select this option, the session-tracking cookie includes a hash value that FortiWeb uses to detect tampering with the cookie from the back-end server response. If FortiWeb determines the cookie from the client has changed, it takes the specified action according to action {alert |alert_deny | block-period | remove_cookie | deny_no_log} (page 360).	no
action {alert |alert_ deny | block-period | remove_cookie | deny_ no_log}	Select one of the following actions that the FortiWeb appliance will perform when it detects cookie poisoning: • alert—Accept the request and generate an alert email and/or log message. • alert_deny—Block the request (or reset the connection) and generate an alert email and/or log message.	alert

Variable	Description	Default
	You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure `block-period <block-period_int>` (page 361). **Note:** If FortiWeb is deployed behind a NAT load balancer, when using this option, you **must** also define an X-header that indicates the original client's IP. For details, see "waf x-forwarded-for" on page 551. Failure to do so may cause FortiWeb to block **all** connections when it detects a violation of this type. • `remove_cookie`—Accept the request, but remove the poisoned cookie from the datagram before it reaches the web server, and generate an alert and/or log message. • `deny_no_log`—Deny a request. Do not generate a log message. **Caution:** This setting will be ignored if `monitor-mode {enable | disable}` (page 146) is enabled. **Note:** Logging and/or alert email will occur only if enabled and configured. See config log disk and config log alertemail. **Note:** If you select an auto-learning profile with this rule, you should select alert. If the action is alert_deny, for example, the FortiWeb appliance will block the request or reset the connection when it detects an attack, resulting in incomplete session information for the auto-learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	
`block-period <block-period_int>`	Enter the number of seconds to block a connection when `action {alert |alert_deny | block-period | remove_cookie | deny_no_log}` (page 360) is set to `block-period`. The valid range is from 1 to 3,600 seconds.	`60`
`severity {High |Medium | Low | Info}`	Select the severity level to use in logs and reports generated when cookie poisoning is detected.	`High`
`trigger "trigger-policy_name>"`	Enter the name of the trigger to apply when cookie poisoning is detected. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing trigger policies, type: `set trigger ?`	No default.

Variable	Description	Default
`cookie-replay-protection-type {no | IP}`	Select whether FortiWeb uses the IP address of a request to determine the owner of the cookie. Because the public IP of a client is not static in many environments, Fortinet recommends that you do not enable Cookie Replay. Available only when `security-mode {no |encrypted | signed}` (page 360) is `encrypted`.	`no`
`max-age <max-age_int>`	Set the cookie security attributes. Enter the maximum age, in minutes, permitted for cookies that do not have an “Expires” or “Max-Age” attribute. To configure no expiry age for cookies, enter 0.	`0`
`secure-cookie {enable | disable}`	Set the cookie security attributes. Enable to add the secure flag to cookies, which forces browsers to return the cookie only when the request is for an HTTPS page.	`disable`
`http-only {enable | disable}`	Set the cookie security attributes. Enable to add the HttpOnly flag to cookies, which prevents client-side scripts from accessing the cookie.	`enable`
`allow-suspicious-cookies {Never |Always | Custom}`	Select whether FortiWeb allows requests that contain cookies that it does not recognize or that are missing cookies. • When `security-mode {no |encrypted | signed}` (page 360) is `encrypted`, suspicious cookies are cookies for which FortiWeb does not have a corresponding encrypted cookie value. • When `cookie-replay-protection-type {no | IP}` (page 362) is `IP`, the suspicious cookie is a missing cookie that tracks the client IP address. In many cases, when you first introduce the cookie security features, cookies that client browsers have cached earlier generate false positives. To avoid this problem, either select `Never`, or select `Custom` and enter an appropriate date on which to start taking the specified action against suspicious cookies. • `Never`—FortiWeb does not take the action specified by `action` against suspicious cookies. • `Always`—FortiWeb always takes the specified action against suspicious cookies. • `Custom`—FortiWeb takes the specified action against suspicious cookies starting on the date specified by `allow-time "<time_`	`Custom`

Variable	Description	Default
	str>" (page 363). This feature is not available if security-mode {no |encrypted | signed} (page 360) is signed.	
allow-time "<time_str>"	Set the date on which FortiWeb starts to take the specified action against suspicious cookies if allow-suspicious-cookies {Never |Always | Custom} (page 362) is Custom.	No default.
<entry_index>	Enter the index number of a new or existing entry in the exception list of the cookie security policy.	No default.
cookie-name "<cookie-name_str>"	Set the exception cookie entry name.	No default.
cookie-domain "<cookie-domain_str>"	Enter the partial or complete domain name or IP address as it appears in the cookie. For example: www.example.com, .google.com or 192.0.2.50.	No default.
cookie-path "<cookie-path_str>"	Enter the path as it appears in the cookie, such as / or /blog/folder.	No default.

- "waf web-protection-profile inline-protection" on page 528

waf csrf-protection

Use this command to protect against cross-site request forgery (CSRF). CSRF is an attack that exploits the trust that a site has in a user's browser to transmit unauthorized commands.

The CRSF protection feature is not supported when the operation mode is Offline Protection or Transparent Inspection.

To protect back-end servers from CSRF attacks, you create two lists of items: a list of web pages to protect against CSRF attacks, and a corresponding list of the URLs found in the requests that the pages generate. For more information on configuring CSRF protection, including troubleshooting and adding parameter filters, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To apply a CSRF protection rule, you select it in an inline protection profile. For details, see "waf web-protection-profile inline-protection" on page 528.

Before you configure a CSRF protection rule, if you want to apply it only to HTTP requests for a specific real or virtual host, you must first define the web host in a protected hosts group. For details, see "server-policy allow-hosts" on page 112.

To use this command, your administrator account's access control profile must have either w or rw permission to the wafgrp area. For details, see "Permissions" on page 55.

Syntax

```
config waf csrf-protection
   edit "<csrf-rule_name>"
      set action {alert | alert_deny | block-period | deny_no_log}
      set block-period <seconds_int>
      set severity {High | Medium | Low | Info}
      set trigger <trigger-policy_name>
      config csrf-page-list
         edit <entry_index>
            set host <host_name>
            set request-url <url_str>
            set host-status {enable | disable}
            set request-type {plain | regular}
            set parameter-filter {enable | disable}
            set parameter-name <parameter-name_str>
            set parameter-value-type {plain | regular}
            set parameter-value <parameter-value_str>
         next
      end
      config csrf-url-list
         edit <entry_index>
            set host <host_name>
            set request-url <url_str>
            set host-status {enable | disable}
            set request-type {plain | regular}
            set parameter-filter {enable | disable}
            set parameter-name <parameter-name_str>
            set parameter-value-type {plain | regular}
            set parameter-value <parameter-value_str>
         next
      end
   next
end
```

Variable	Description	Default
"<csrf-rule_name>"	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: edit ?	No default.
action {alert | alert_deny | block-period | deny_no_log}	Enter the action that FortiWeb takes when it detects a missing or incorrect anti-CSRF parameter: • alert—Accept the request and generate an alert email, a log message, or both. • alert_deny—Block the request (reset the connection) and generate an alert email, a log message, or both. You can customize the web page that FortiWeb returns to the	alert

Variable	Description	Default
	client with the HTTP status code. For details, see "system replacemsg" on page 296. • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure `block-period <seconds_int>` (page 365). • `deny_no_log`—Deny a request. Do not generate a log message. **Note:** Logging and alert email occur only if the corresponding settings are enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71.	
`block-period <seconds_int>`	Enter the number of seconds that you want to block subsequent requests from the client after the FortiWeb appliance detects a CSRF attack. The valid range is 1–3,600. This setting applies only if `action {alert | alert_deny | block-period | deny_no_log}` (page 364) is `block-period`.	`60`
`severity {High | Medium | Low | Info}`	Select the severity level to use in any logs and reports that FortiWeb generates when a violation of this rule occurs.	`Low`
`trigger <trigger-policy_name>`	Enter the name of the trigger to apply when this rule is violated. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table.	No default.
`host <host_name>`	Enter a protected host name (either a web host name or IP address) that the `Host:` field of the HTTP request matches. This setting applies only if `host-status {enable | disable}` (page 365) is `enable`.	No default.
`request-url <url_str>`	Enter either a literal URL or regular expression, depending on the value of `request-type`.	No default.
`host-status {enable | disable}`	Enter `enable`to apply this rule only to HTTP requests for specific web hosts. Also configure `host`. Disable to match the rule based on the URL and any parameter filter only.	`disable`

Variable	Description	Default
`request-type {plain | regular}`	Select whether `request-url <url_str>` (page 365) contains a literal URL (`plain`), or a regular expression designed to match multiple URLs (`regular`).	`plain`
`parameter-filter {enable | disable}`	Enter `enable` to specify a parameter name and value to match. The parameter can be located in either the URL or the HTTP body of a request.	`disable`
`parameter-name <parameter-name_str>`	Enter the name of the parameter name to match.	No default.
`parameter-value-type {plain | regular}`	Select whether `parameter-value <parameter-value_str>` (page 366) contains a literal value (`plain`) or a regular expression designed to match multiple parameters (`regular`).	`plain`
`parameter-value <parameter-value_str>`	Enter either a literal parameter or regular expression, depending on the value of `parameter-value-type {plain | regular}` (page 366). To match any parameter value, for `parameter-value-type`, enter `regular`, and for `parameter-value`, enter `*` (asterisk).	No default.

Example

The web page `csrf_login.html` contains the following HTML form:

```
<form name="do_some_action" id="form1" action="csrf_test2.php" method="GET">
   <input type="text" name="username" value=""/>
   <Input type="text" name="password" value=""/>
   <input type="submit" value="do Action"/>
</form>
```

This form generates the following request when the page is added to the list of pages protected by a CSRF protection policy:

```
http://target-site.com/csrf_
    test2.php?username=test&password=123&tknfv=3DF5BDCCIG3DCXNTE3RUNCTKRS3E36AD
```

The CSRF protection feature adds the parameter `tknfv` with a value that matches the session ID.

To create this example, you add `csrf_login.html` to the list of pages and `/csrf_check2.php` to the list of URLs.

```
config waf csrf-protection
   edit "csrf_rule1"
      set action alert_deny
      config csrf-page-list
         edit 1
            set request-url "csrf_login.html"
            set request-type regular
         next
      end
      config csrf-url-list
```

```
        edit 1
           set request-url "/csrf_check2.php"
           set request-type plain
        next
      end
   next
end
```

waf custom-access policy

Use this command to configure custom access policies. Custom access policies group custom access rules.

To apply a custom access policy, select it within an inline protection profile or Offline Protection profile. For details, see "waf web-protection-profile inline-protection" on page 528 or "waf web-protection-profile offline-protection" on page 541.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf custom-access policy
   edit "<custom-policy_name>"
      config rule
         edit <entry_index>
            set rule-name "<custom-rule_name>"
         next
      end
   next
end
```

Variable	Description	Default
`"<custom-policy_name>"`	Enter the name of a new or existing custom policy. The maximum length is 63 characters. To display a list of the existing policies, enter: `edit ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,223,372,036,854,775,807.	No default.
`rule-name "<custom-rule_name>"`	Enter the name of the existing custom access rule to add to the policy. The maximum length is 63 characters.	No default.

Example

For an example, see "waf custom-access rule" on page 368.

waf custom-access rule

Use this command to configure custom access rules.

What if you want to allow a web crawler, but only if it is not too demanding, and comes from a source IP that is known to be legitimate for that crawler? What if you want to allow only a client that is a senior manager's IP, and only if it hasn't been infected by malware whose access rate is contributing to a DoS?

Advanced access control rules provide a degree of flexibility for these types of complex conditions. You can combine any or all of these criteria:

- Source IP
- User
- Http Session
- Rate limit (including rate limiting for specific types of content)
- HTTP header or response code
- URL
- Predefined or custom attack or data leak signature violation
- Transaction or packet interval timeout
- Real browser enforcement
- CAPTCHA enforcement

In the rule, add all criteria that you require allowed traffic to match.

Before you can apply a custom access rule, you must first group it with any others that you want to apply in a custom access policy. For details, see "waf custom-access policy" on page 367.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf custom-access rule
   edit "<custom-access_name>"
      set action {alert | alert_deny | block-period | deny_no_log}
      set block-period <seconds_int>
      set severity {High | Medium | Low | Info}
      set trigger "<trigger-policy_name>"
      set bot-recognition {captcha-enforcement | real-browser-enforcement | disable}
      set max-attempt-times <attempts_int>
      set validation-timeout <seconds_int>
      config access-limit-filter
         edit <entry_index>
            set access-rate-limit <rate_int>
```

```
end
config http-header-filter
   edit <entry_index>
      set header-name-type {custom | predefined}
      set header-field-check {enable | disable}
      set predefined-header {host | connection | authorization | x-pad  | cookie |
          referer | user-agent  | X-Forwarded-For | Accept}
      set pre-header-type {plain | regular}
      set pre-header-rev-match {enable | disable}
      set custom-header-name "<key_str>"
      set cus-header-type {plain | regular}
      set cus-header-name-type {plain | regular}
      set cus-header-rev-match {enable | disable}
      set header-value "<value_str>"
      set http-method-check {enable | disable}
      set http-method-value-type {plain | regular}
      set http-method-value "<http-method-value_str>"
      set http-method-rev-match {enable | disable}
end
config source-ip-filter
   edit <entry_index>
      set source-ip <ip_range>
      set exclusive-match {no | yes}
end
config user-filter
   edit <entry_index>
      set reverse-match {no | yes}
      set user-name "<user-name_str>"
end
config geo-filter
   edit <entry_index>
      set match-exclusive {yes | no}
      set country-list <country-list_str>
end
config url-filter
   edit <entry_index>
      set request-file "<url_str>"
      set reverse-match {no | yes}
end
config http-transaction
   edit <entry_index>
      set http-transation-timeout "<timeout_int>"
end
config response-code
   edit <entry_index>
      set <response-code_int>
      set response-code-max <response-code_int>
end
config content-type
   edit <entry_index>
      set {text/html text/plain text/xml application/xml application/soap+xml
          application/json}
end

   edit <entry_index>
      set packet-interval-timeout <timeout_int>
   end
```

```
      config signature-class
        edit {010000000 | 020000000 | 030000000 | 040000000 | 050000000 | 060000000 |
            090000000| 100000000 | 110000000 | 120000000}
          set status {enable | disable}
        end
      config custom-signature
        edit <entry_index>
          set custom-signature-enable {enable | disable}
          set {custom-signature-group | custom-signature}
          set "<custom-signature-name_str>"
        end
      config ftp-security
        edit <entry_index>
          set custom-signature-enable {enable | disable}
          set {custom-signature-group | custom-signature}
          set "<custom-signature-name_str>"
        end
      config occurrence
        edit <entry_index>
          set occurrence-num "<occurrence_int>"
          set within "<within_int>"
          set percentage-flag {enable | disable}
          set percentage "<percentage_int>"
          set traced-by {Source-IP | User | Http-Session}
      end
    next
  end
```

Variable	Description	Default
"<custom-access_name>"	Enter the name of a new or existing custom access rule. The maximum length is 63 characters. To display a list of the existing rule, enter: `edit ?`	No default.
action {alert | alert_ deny | block-period | deny_no_log}	Select the specific action to be taken when the request matches the signature. • `alert`—Accept the request and generate an alert email and/or log message. **Note:** If `type {request | response}` (page 383) is response, it does **not** cloak, except for removing sensitive headers. Sensitive information in the body remains unaltered. • `alert_deny`—Block the request (or reset the connection) and generate an alert email and/or log message. This option is applicable only if `type` is	`alert`

Variable	Description	Default
	`signature-creation`. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure `block-period <seconds_int>` (page 371). • `deny_no_log`—Deny a request. Do not generate a log message. **Note:** If FortiWeb is deployed behind a NAT load balancer, when using this option, you **must** also define an X-header that indicates the original client's IP. Failure to do so may cause FortiWeb to block **all** connections when it detects a violation of this type. For details, see "waf x-forwarded-for" on page 551.	
`block-period <seconds_int>`	Enter the length of time (in seconds) for which the FortiWeb appliance will block additional requests after a source IP address violates this rule. The block period is shared by all clients whose traffic originates from the source IP address. The valid range is 1–10,000 .	`60`
`severity {High | Medium | Low | Info}`	Select the severity level to use in logs and reports generated when a violation of the rule occurs.	`High`
`trigger "<trigger-policy_name>"`	Enter the name of the trigger to apply when this policy is violated. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
`bot-recognition {captcha-enforcement | real-`	Select between:	`disable`

Variable	Description	Default
`browser-enforcement | disable}`	• `captcha-enforcement`—Requires the client to successfully fulfill a CAPTCHA request. If the client cannot successfully fulfill the request within the `max attempt-times`, or doesn't fulfill the request within the `validation-timeout`, FortiWeb applies the `action` and sends the CAPTCHA block page. • `real-browser-enforcement`—Enable to return a JavaScript to the client to test whether it is a web browser or automated tool when it violates the access rule. If the client either fails the test or does not return results before the timeout specified by `validation-timeout <seconds_int>` (page 372), FortiWeb applies the specified action. If the client appears to be a web browser, FortiWeb allows the client to violate the rule. • `disable`—Disable this option to simply apply the access rule.	
`max-attempt-times <attempts_int>`	If `captcha-enforcement` is selected for `bot-recognition {captcha-enforcement | real-browser-enforcement | disable}` (page 371), enter the maximum number of attempts that a client may attempt to fulfill a CAPTCHA request. The valid range is 1–5. Available only when `captcha-enforcement` is selected for `bot-recognition`.	`3`
`validation-timeout <seconds_int>`	Specifies the maximum amount of time that FortiWeb waits for results from the web browser test. The valid range is 5–30.	`20`
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.

Variable	Description	Default
`access-rate-limit <rate_int>`	Enter the rate threshold for source IP addresses. The valid range is 1–65535. To disable the rate limit, enter `0`. **Note:** Blocking a shared source IP address could block innocent clients that share the same source IP address with an offending client.	`1`
`header-name-type {custom | predefined}`	Select whether to define the HTTP header filter by selecting a predefined HTTP header name, or by typing the name of a custom HTTP header. Also configure header-value "<value_str>" and, depending on which you indicate in this option, either: • `predefined-header {host | connection | authorization | x-pad | cookie | referer | user-agent | X-Forwarded-For | Accept}` (page 373) • `pre-header-type {plain | regular}` (page 373) • `pre-header-rev-match {enable | disable}` (page 374) • pre-header-rev-match {enable | disable} • `pre-header-rev-match {enable | disable}` (page 374) • pre-header-rev-match {enable | disable}	`predefined`
`header-field-check {enable | disable}`	Enable/disable checking the HTTP header field.	No default.
`predefined-header {host | connection | authorization | x-pad | cookie | referer | user-agent | X-Forwarded-For | Accept}`	Select the name (key) of the HTTP header such as `Accept:` that must be present in order for the request to be allowed. This field appears only if `header-name-type {custom | predefined}` (page 373) is `predefined`.	`host`
`pre-header-type {plain | regular}`	Indicate whether `header-value "<value_str>"` (page 375) is a literal header value	`plain`

Variable	Description	Default
	(`plain`) or a regular expression that indicates multiple possible valid header values (`regular`).	
`pre-header-rev-match {enable | disable}`	Indicate how to use `predefined-header {host | connection | authorization | x-pad | cookie | referer | user-agent | X-Forwarded-For | Accept}` (page 373) and `header-value "<value_str>"` (page 375) when determining whether or not this condition has been met. • `no`—If the regular expression **does** match the request object, the condition is met. • `yes`—If the regular expression does **not** match the request object, the condition is met. The effect is equivalent to preceding a regular expression with an exclamation point (`!`). If all conditions are met, the FortiWeb appliance will allow access.	`disable`
`custom-header-name "<key_str>"`	Enter the name (key) **without** the trailing colon (`:`), such as `X-Real-IP`, of the HTTP header that must be present in order for the request to be allowed. This field appears only if `header-name-type {custom | predefined}` (page 373) is `custom`.	No default.
`cus-header-type {plain | regular}`	Indicate whether `header-value "<value_str>"` (page 375) is a literal header value (`plain`) or a regular expression that indicates multiple possible valid header values (`regular`).	`plain`
`cus-header-name-type {plain | regular}`	Indicate whether `custom-header-name "<key_str>"` (page 374)is a literal header name (`plain`) or a regular expression that indicates multiple possible valid header names (`regular`).	`plain`
`cus-header-rev-match {enable | disable}`	Indicate how to use `custom-header-name "<key_str>"` (page 374) and `header-value "<value_str>"` (page	`disable`

Variable	Description	Default
	375) when determining whether or not this condition has been met. • `no`—If the regular expression **does** match the request object, the condition is met. • `yes`—If the regular expression does **not** match the request object, the condition is met. The effect is equivalent to preceding a regular expression with an exclamation point (`!`). If all conditions are met, the FortiWeb appliance will allow access.	
`http-method-check {enable | disable}`	Enable **HTTP Method Check** and configure a plain string or regular expression for the HTTP method that FortiWeb will search for in the header field.	`disable`
`http-method-value-type {plain | regular}`	Select a plain string or regular string.	No default.
`http-method-value "<http-method-value_str>"`	To prevent accidental matches, specify as much of the header's value as possible. Do not use an ambiguous substring.	No default.
`http-method-rev-match {enable | disable}`	When you enable **HTTP Method Check**, you can also enable **HTTP Method Reverse Match** so that the request matches the condition if the header does not contain the HTTP method's exact value or regular expression.	`disable`
`header-value "<value_str>"`	Depending on your selection in `pre-header-type {plain | regular}` (page 373), either: • Type the literal header value, such as `192.0.2.80`, your specified HTTP header must **contain** in order to match the filter. Value matching is **case sensitive**. (If you require a filter based upon more than one HTTP header, create multiple entries in the set, one for each HTTP header.). • Type a regular expression, such as `192\.0\.2\.*`, matching all and only the header values which accepted HTTP header values must match. For details about language and regular expression matching, see the *FortiWeb*	No default.

Variable	Description	Default
	Administration Guide: https://docs.fortinet.com/fortiweb/admin-guides **Tip:** To prevent accidental matches, specify as much of the header's value as possible. Do not use an ambiguous substring. For example, entering the value `192.0.2.1` would **also** match the IPs 192.0.2.10-19 and 192.0.2.100-199. This result may be unintended. The better solution would be to configure either: • A regular expression such as `^192.0.2.1$` or • A source IP condition instead of an HTTP header condition	
`source-ip <ip_range>`	Enter the IP address or IP address range that specifies the clients that FortiWeb allows. For example: • `1.2.3.4` • `2001::1` • `1.2.3.4-1.2.3.40` • `2001::1-2001::100` Depending on your configuration of how FortiWeb will derive the client's IP (see "waf x-forwarded-for" on page 551), this may be the IP address that is indicated in an HTTP header rather than the IP header.	No default.
`exclusive-match {no | yes}`	Set whether the condition can be met when source IP does not match.	`No`
`reverse-match {no | yes}`	Indicate how to use `user-name "<user-name_str>"` (page 377) when determining whether or not this rule's condition has been met. • `no`—If the regular expression **does** match the user name, the condition is met. • `yes`—If the regular expression does **not** match the user name, the condition is met.	`no`

Variable	Description	Default
	The effect is equivalent to preceding a regular expression with an exclamation point (`!`).	
`user-name "<user-name_str>"`	Enter the user name to match.	No default.
`request-file "<url_str>"`	Enter a regular expression that defines either all matching or all non-matching URLs. Then, also configure `reverse-match {no | yes}` (page 376). For example, for the URL access rule to match all URLs that begin with `/wordpress`, you could enter `^/wordpress`, then, in `reverse-match {yes | no}`, select `no`. The pattern is **not** required to begin with a slash (/). The maximum length is 255 characters. **Note:** Regular expressions beginning with an exclamation point (`!`) are not supported. Instead, use `reverse-match {yes | no}`.	No default.
`reverse-match {no | yes}`	Indicate how to use `request-file "<url_str>"` (page 377) when determining whether or not this rule's condition has been met. • `no`—If the regular expression **does** match the request URL, the condition is met. • `yes`—If the regular expression does **not** match the request URL, the condition is met. The effect is equivalent to preceding a regular expression with an exclamation point (`!`).	`no`
`http-transation-timeout "<timeout_int>"`	Enter a timeout value of 1–3600 seconds. If the lifetime of a HTTP transaction exceeds this value, the transaction matches this condition.	`5`
`<response-code_int>`	Specify the start and end code in a range of HTTP response codes. To specify a single code, enter the same	`404`

Variable	Description	Default
	value for the start and end codes (for example, `404-404` or `500-503`). If its HTTP response code is within this range, the HTTP transaction matches this condition.	
`response-code-max <response-code_int>`	Specify the maximum start and end code in a range of HTTP response codes.	No default.
`{text/html text/plain text/xml application/xml application/soap+xml application/json}`	Specify a file content type to match. Use with `occurrence` to detect and control web scraping (content scraping) activity.	`application/soap+xml application/xml (or)text/xml text/html text/plain application/json`
`packet-interval-timeout <timeout_int>`	Specify the maximum number of seconds allowed between packets arriving from either the client or server (request or response packets), in seconds. Enter a value from 1 to 60. If the interval exceeds this value, the HTTP transaction matches this condition.	`1`
`{010000000 | 020000000 | 030000000 | 040000000 | 050000000 | 060000000 | 090000000| 100000000 | 110000000 | 120000000}`	Specify the ID of a signature class. Ensure the signature is enabled in signature configuration before you use it in an advanced access control rule. For details, see "waf signature" on page 472.	No default.
`status {enable | disable}`	Specify whether the HTTP transaction matches this condition if it matches the specified signature.	`disable`
`custom-signature-enable {enable | disable}`	Specify whether the current custom signature filter is enabled.	`disable`
`{custom-signature-group | custom-signature}`	Specify whether `"<custom-signature-name_str>"` (page 378) specifies a custom signature group or an individual signature.	`custom-signature-group`
`"<custom-signature-name_str>"`	Specify the custom signature group or individual signature to match. Ensure the signature is enabled in signature configuration before you use it in an advanced access control rule. For details, see "waf signature" on page 472.	No default.

Variable	Description	Default
`occurrence-num "<occurrence_int>"`	Specify the maximum number of times a transaction can match other filter types in the current rule during the time period specified by `within`. Enter a value between 1–100,000. If the number of matches exceeds this threshold, the associated HTTP source client IP address or client matches this condition.	`1`
`within "<within_int>"`	Specify the time period during which FortiWeb counts the number of times transactions match other filter types in the current rule. Enter a value between 1–600.	`1`
`percentage-flag {enable | disable}`	Specify whether the current filter matches when the rate of matches with other filter types in the current rule exceeds the `percentage "<percentage_int>"` (page 379).	`disable`
`percentage "<percentage_int>"`	The maximum rate of matches with other filter types in the current rule, expressed as percent of hits. If `percentage-flag {enable | disable}` (page 379) is enabled and the number of matches exceeds this threshold, the associated HTTP source client IP address or client matches this condition.	No default.
`traced-by {Source-IP | User | Http-Session}`	Specify whether FortiWeb determines the rate at which a transaction matches other filter types in the current rule by counting matches by source client IP address or by client. To specify `user`, ensure that the value of `http-session-management {enable | disable}` (page 531) is `enable`.	`source-ip`
`<entry_index>`	Enter the index number of the individual entry in the table.	No default.
`match-exclusive {yes | no}`	If you select Yes, FortiWeb matches the	`No`

Variable	Description	Default
	traffic from all countries except the ones you select. If you select No, FortiWeb matches the traffic from the countries you select.	
`country-list <country-list_str>`	Enter the countries you select.	No default.

Example

This example allows access to URLs beginning with “/admin”, but only if they originate from `192.0.2.5`, and only if the client does not exceed 5 requests per second.

Clients that violate this rule will be blocked for 60 seconds (the default duration). The violation will be logged in the attack log using `severity_level=High`, and all servers configured in `notification-servers1` will be used to notify the network administrator.

```
config waf custom-access rule
   edit "combo-IP-rate-URL-rule1"
      set action block-period
      set severity High
      set trigger "notification-servers1"
      config access-limit-filter
         edit 1
            set access-rate-limit 5
         next
      end
      config source-ip-filter
         edit 1
            set source-ip "192.0.2.5"
         next
      end
      config url-filter
         edit 1
            set request-file "/admin*"
         next
      end
   next
end
config waf custom-access policy
   edit "combo-IP-rate-URL-policy1"
      config rule
         edit 1
            set rule-name "combo-access-rate-rule1"
         next
      end
   next
end
```

- "waf signature" on page 472

waf custom-protection-group

Use this command to configure custom protection groups, creating sets of custom protection rules that can be used with attack signatures (“server protection rule”).

Before you can configure this command, you must first define your custom data leak and attack signatures. For details, see "waf custom-protection-rule" on page 382.

To use this command, your administrator account’s access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf custom-protection-group
   edit "<custom-protection group_name>"
      config type-list
         edit <entry_index>
            set custom-protection-rule "<rule_name>"
         next
      end
   next
end
```

Variable	Description	Default
`"<custom-protection group_name>"`	Enter the name of a new or existing group. The maximum length is 63 characters. To display the list of existing group, enter: `edit ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`custom-protection-rule "<rule_name>"`	Enter the name of the custom protection rule to associate with the custom protection group. The maximum length is 63 characters. To display a list of the existing rules, enter: `set custom-protection-rule ?`	No default.

Example

This example groups `custom protection rule 1` and `custom protection rule 3` together within `Custom Protection group 1`.

```
config waf custom-protection-group
   edit "Custom Protection group 1"
      config type-list
         edit 1
               set custom-protection-rule "custom protection rule 3"
            next
            edit 3
               set custom-protection-rule "custom protection rule 1"
            next
         end
   next
end
```

waf custom-protection-rule

Use this command to configure custom data leak and attack signatures.

Before you enter custom signatures via the CLI, first enable .

To use your custom signatures, you must first group them so that they can be included in a rule. For details, see "waf custom-protection-group" on page 381.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf custom-protection-rule
   edit "<custom-protection rule_name>"
      set type {request | response}
      set action {alert | alert_deny | alert_erase | redirect | block-period | send_
          http_response | only_erase | deny_no_log}
      set block-period <seconds_int>
      set severity {High | Medium | Low | Info}
      set trigger "<trigger-policy_"name>
      config meet-condition
         edit <entry_index>
            set operator {RE | GT | LT | NE | EQ}
```

```
            set request-target {REQUEST_FILENAME REQUEST_URI REQUEST_HEADERS_NAMES
                REQUEST_HEADERS REQUEST_COOKIES_NAMES REQUEST_COOKIES ARGS_NAMES ARGS_
                VALUE REQUEST_RAW_URI REQUEST_BODY CONTENT_LENGTH HEADER_LENGTH BODY_
                LENGTH COOKIE_NUMBER ARGS_NUMBER HTTP_METHOD}
            set response-target {RESPONSE_BODY RESPONSE_HEADER CONTENT_LENGTH HEADER_
                LENGTH BODY_LENGTH RESPONSE_CODE}
            set threshold <threshold_int>
            set case-sensitive {enable | disable}
            set expression <regex_pattern>
          next
        end
      next
    end
```

Variable	Description	Default
"<custom-protection rule_name>"	Enter the name of the new or existing custom signature. The maximum length is 63 characters. To display a list of the existing rules, enter: `edit ?`	No default.
type {request | response}	Specify the type of regular expression: • `request`—The expression is an attack signature. • `response`—The expression is a server information disclosure signature.	`request`
action {alert | alert_deny | alert_erase | redirect | block-period | send_http_response | only_erase | deny_no_log}	Select the specific action to be taken when the request matches the this signature. • `alert`—Accept the request and generate an alert email and/or log message. **Note:** If `type {request | response}` (page 383) is `response`, it does **not** cloak, except for removing sensitive headers. Sensitive information in the body remains unaltered. • `alert_deny`—Block the request (or reset the connection) and generate an alert email and/or log message. This option is applicable only if `type` is `signature-creation`. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. • `alert_erase`—Hide replies with sensitive information (sometimes called “cloaking”). Block the reply (or reset the connection) or remove the sensitive information, and generate an alert email and/or log message.	`alert`

Variable	Description	Default
	If the sensitive information is a status code, you can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. **Note:** This option is not fully supported in Offline Protection mode. Effects will be identical to `alert`; sensitive information will not be blocked or erased. • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure `block-period <seconds_int>` (page 437). **Note:** If FortiWeb is deployed behind a NAT load balancer, when using this option, you **must** also define an X-header that indicates the original client's IP. Failure to do so may cause FortiWeb to block **all** connections when it detects a violation of this type. For details, see "waf x-forwarded-for" on page 551. • `redirect`—Redirect the request to the URL that you specify in the protection profile and generate an alert email and/or log message. Also configure `redirect-url "<redirect_fqdn>"` (page 539) and `rdt-reason {enable | disable}` (page 539). • `send_http_response`—Block and reply to the client with an HTTP error message, and generate an alert email, a log message, or both. • `only_erase`—Hide replies with sensitive information (sometimes called "cloaking"). Block the reply (or reset the connection) or remove the sensitive information without generating an alert email and/or log message. This option is applicable only if `type` is `response`; and this option is not supported in Offline Protection mode. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. • `deny_no_log`—Deny a request. Do not generate a log message.	
	Caution: This setting will be ignored if `monitor-mode {enable | disable}` (page 146) is enabled. **Note:** Logging and/or alert email will occur only if enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71.	

Variable	Description	Default
	Note: If an auto-learning profile will be selected in the policy with Offline Protection profiles that use this rule, you should select `alert`. If the `action {alert | alert_deny | alert_erase | redirect | block-period | send_http_response | only_erase | deny_no_log}` (page 383) is `alert_deny`, the FortiWeb appliance will reset the connection when it detects an attack, resulting in incomplete session information for the auto-learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	
`block-period <seconds_int>`	If `action {alert | alert_deny | alert_erase | redirect | block-period | send_http_response | only_erase | deny_no_log}` (page 383) is `block-period`, enter the number of seconds that you want to block subsequent requests from the client after the FortiWeb appliance detects that the client has violated the rule. For details about viewing the list of currently blocked clients, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides The valid range is 1–3,600.	`1`
`severity {High | Medium | Low | Info}`	When rule violations are recorded in the attack log, each log message contains a **Severity Level** (`severity_level`) field. Select which severity level the FortiWeb appliance will use when it logs a violation of the rule.	`Medium`
`trigger "<trigger-policy_"name>`	Select which trigger policy, if any, that the FortiWeb appliance will use when it logs and/or sends an alert email about a violation of the rule. For details, see `log trigger-policy` (page 105). The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is from 1–9,999,999,999,999,999,999.	No default.
`operator {RE | GT | LT | NE | EQ}`	• `RE`—The signature matches when the value of a selected target in the request or response matches the value of `expression`. • `GT`—The signature matches when specified target has a value greater than the value of `threshold`. • `LT`—The signature matches when specified target has a value	`RE`

Variable	Description	Default
	less than the value of `threshold`. • `NE`— The signature matches when specified target has a different value than `threshold`. • `EQ`— The signature matches when specified target has the same value as `threshold`.	
`request-target {REQUEST_FILENAME REQUEST_URI REQUEST_HEADERS_NAMES REQUEST_HEADERS REQUEST_COOKIES_NAMES REQUEST_COOKIES ARGS_NAMES ARGS_VALUE REQUEST_RAW_URI REQUEST_BODY CONTENT_LENGTH HEADER_LENGTH BODY_LENGTH COOKIE_NUMBER ARGS_NUMBER HTTP_METHOD}`	Enter the name of one or more locations in the HTTP request to scan for a signature match. For example, `ARGS_NAMES` for the names of parameters or `REQUEST_COOKIES` for strings in the HTTP `Cookie:` header.	No default.
`response-target {RESPONSE_BODY RESPONSE_HEADER CONTENT_LENGTH HEADER_LENGTH BODY_LENGTH RESPONSE_CODE}`	Enter the name of one or more locations in the HTTP response to scan for a signature match.	No default.
`threshold <threshold_int>`	Enter the value that FortiWeb compares to the target value to determine if a request or response matches.	No default.
`case-sensitive {enable | disable}`	Enable to differentiate upper case and lower case letters when evaluating the web server's response for data leaks according to `expression <regex_pattern>` (page 386). For example, when enabled, an HTTP reply containing the phrase `Credit card` would **not** match an expression that looks for the phrase `credit card` (difference highlighted in bold).	`disable`

`expression <regex_pattern>`	When `operator {RE | GT | LT | NE | EQ}` (page 385) is `RE`, type a regular expression that matches either an attack from a client or a data leak from the server.
	If `action` is Alert & Erase, enclose the portion of the regular expression to erase in brackets.
	For example, the following command erases the expression "webattack" from the response packet:
	`config waf custom-protection-rule`
	`edit "test"`
	`set type response`
		No default.

Variable	Description	Default

	<pre>set action alert_erase
	config meet-condition
	edit 1
	set response-target RESPONSE_
	BODY
	set expression "(webattack)"
	next
	end
	next
	end</pre>
	To prevent false positives, it should not match anything else.
	The maximum length is 2,071 characters.	

Example

This example configures a signature to detect and block an LFI attack that uses directory traversal through an unsanitized `controller` parameter in older versions of Joomla. Each time it detects an attack, the trigger policy named `notification-servers1` sends an alert email and attack log messages whose severity level is `High`.

```
config waf custom-protection-rule
   edit "Joomla_controller_LFI"
      set type request
      set action alert_deny
      set severity High
      set trigger "notification-servers1"
      config meet-condition
         edit 1
            set request-target REQUEST_RAW_URI
            set expression "^/index\.php\?option=com_ckforms\&controller=(\.\.\/)+?"
         next
      end
   next
end
```

waf device-reputation

Use this command to create or edit a device reputation security policy.

When Device Tracking is enabled and a device reputation security policy is selected, FortiWeb evaluates the reputation of client devices that trigger security violations. If a device triggers a security violation in a device reputation security policy, it will acquire a lower device reputation. Access to networks and servers can be managed according to a device's reputation.

For information on device reputation security policies, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf device-reputation reputation-security-policy
   edit "<policy_name>"
      set action-for-high-level {alert | alert_deny | block-period | deny_no_log}
      set action-for-low-level {alert | alert_deny | block-period | deny_no_log}
      set action-for-medium-level {alert | alert_deny | block-period | deny_no_log}
      set action-for-unindentified {alert | alert_deny | block-period | using_local_
          action | deny_no_log}
      set high-level-score-begin <weight_int>
      set low-level-score-end <weight_int>
      set reputation-exception-rule "<rule_name>"
   next
config waf device-reputation reputation-exceptions
   edit "<exception_name>"
      config reputation-exceptions-list
         edit <ID_int>
            set feature-name "<exception_name>"
            next
         delete <ID_int>
         purge <y/n>
      end
   next
end
```

Variable	Description	Default
`"<policy_name>"`	Enter the name of the device reputation security policy to be created or edited. The maximum length is 63 characters.	No default.
`action-for-high-level {alert | alert_deny | block-period | deny_no_log}`	Set the action for a device based on its risk level. The options are: • `alert`—Accept the request and generate an alert email and/or log message. • `alert_deny`—Block the request (or reset the connection) and generate an alert email and/or log message. You can customize the web page that returns to the client with the HTTP status code. For details, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure Block Period. You can customize the web page that returns to the client with the HTTP status code. For details, see the	`alert_deny`

Variable	Description	Default

`action-for-low-level {alert | alert_deny | block-period | deny_no_log}`
 	
`action-for-medium-level {alert | alert_deny | block-period | deny_no_log}`
 	
`action-for-unindentified {alert | alert_deny | block-period | using_local_action | deny_no_log}`
	FortiWeb Administration Guide:
	https://docs.fortinet.com/fortiweb/admin-guides
	`using_local_action`—Takes the local action specified in a protection profile.
	`deny_no_log`—Deny a request. Do not generate a log message.
		`alert`
		
		`alert_deny`
		
		`using_local_action`

`high-level-score-begin <weight_int>`	Sets the weight range for a high risk level. The acceptable range is 3–1000.	200
`low-level-score-end <weight_int>`	Sets the weight range for a low risk level. The acceptable range is 2–1000.	50
`reputation-exception-rule "<rule_name>"`	Enter the name of the device reputation exceptions, if any.	No default.
`"<exception_name>"`	Enter the name of the device reputation exception to be created or edited. The maximum length is 63 characters.	No default.
`<ID_int>`	Enter the Security Feature Name ID to be created or edited.	No default.
`feature-name "<exception_name>"`	Enter the name of the security feature name to be included as a reputation exception. The available security feature names are: • `bad_robot` • `cookie_security_policy` • `cross_site_scripting` • `cross_site_scripting_extended` • `csrf_protection` • `custom_policy` • `custom_signature` • `dos_protection` • `file_upload_restriction` • `generic_attacks` • `generic_attacks_extended` • `hidden_field_protection`	No default.

Variable	Description	Default
	• http_protocol_constraints • illegal_json_format • illegal_xml_format • ip_reputation • know_exploits • padding_oracle_protection • parameter_validation • sql_injection • sql_injection_extended • sql_injection_syntax • trojans • user_tracking	
delete <ID_int>	Deletes a security feature from the list of device reputation exceptions according to its ID.	No default.
purge <y/n>	Deletes all security feature exceptions.	No default.

Example

This example creates a device reputation security policy and defines a device reputation exception.

```
config waf device-reputation reputation-security-policy
   edit "<policy1>"
      set action-for-high-level alert_deny
      set action-for-low-level alert
      set action-for-medium-level alert
      set action-for-unindentified block-period
      set block-period-unindentified-level 60
      set high-level-score-begin 300
      set low-level-score-end 100
      set reputation-exception-rule "<exception_rule1>"
      next
   end
config waf device-reputation reputation-exceptions
   edit "<exception1>"
      config reputation-exceptions-list
         edit 1
            set feature-name trojans
            next
         end
      end
```

waf exclude-url

Use this command to configure URLs that are exempt from a file compression or file decompression rule.

To apply an exclusion, include it in a compression or decompression rule. For details, see "waf file-compress-rule" on page 393.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf exclude-url
   edit "<rule_name>"
      config exclude-rules
         edit <entry_index>
            set host "<protected-host_name>"
            set host-status {enable | disable}
            set request-file "<url_str>"
         next
      end
   next
end
```

Variable	Description	Default
`"<rule_name>"`	Enter the name of a new or existing exception. The maximum length is 63 characters. To display a list of the existing exceptions, enter: `edit ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`host "<protected-host_name>"`	Enter the name of a protected host that the `Host:` field of an HTTP request must be in order to match the exception. The maximum length is 255 characters. This setting applies only if `host-status {enable | disable}` (page 392) is `enable`.	No default.

Variable	Description	Default
`host-status {enable | disable}`	Enable to apply this exception only to HTTP requests for specific web hosts. Also configure `host "<protected-host_name>"` (page 391). Disable to match the exception based upon the other criteria, such as the URL, but regardless of the `Host:` field.	`disable`
`request-file "<url_str>"`	Enter the literal URL, such as `/archives`, to which the exception applies. The URL must begin with a slash (/). Do not include the name of the host, such as `www.example.com`, which is configured separately using `host`. The maximum length is 255 characters.	No default.

Example

This example configures two exclusion rules, one for compression and the other for decompression. Either rule can be referenced by name in a file compression or file decompression rule.

```
config waf exclude-url
   edit "Compression Exclusion"
      config exclude-rules
         edit 1
            set host "192.0.2.2"
            set host-status enable
            set request-file "/archives"
         next
      end
   next
   edit "Decompression Exclusion"
      config exclude-rules
         edit 1
            set host "www.example.com"
            set host-status enable
            set request-file "/products.cfm"
         next
      end
   next
end
```

waf fds-update-flag

Delete this text and replace it with your own content.

waf file-compress-rule

Use this command to compress specific file types in HTTP replies.

Compression can reduce bandwidth, which can reduce delivery time to end users. Modern browsers automatically decompress files before they display web pages.

You can configure most web servers to compress files when they respond to a request. However, if you do not want to configure each of your web servers separately, or if you want to offload compression for performance reasons, you can configure FortiWeb to do the compression.

By default, the maximum pre-compressed file size is 64 KB. FortiWeb transmits files larger than the maximum without compression. You can use the `config system advanced` command's `max-cache-size` setting to adjust the maximum files size. For details, see "system advanced" on page 201.

To apply a compression rule, select it in an inline protection profile. For details, see "waf web-protection-profile inline-protection" on page 528.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf file-compress-rule
   edit "<rule_name>"
      set compression-type {gzip | brotli}
      set compression-level {level1 | level2 | level3 | level4 | level5 | level6 |
          level7 | level8 | level9 | level10 | level11}
      set exclude-url "<exclusion-rule_name>"

   next
end
      config content-types
         edit "<content-types_id>"
            set content-type "<content-type_name>"

end
```

Variable	Description	Default
`"<rule_name>"`	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`compression-type {gzip | brotli}`	Set the file compression type.	No default.

Variable	Description	Default
`compression-level {level1 | level2 | level3 | level4 | level5 | level6 | level7 | level8 | level9 | level10 | level11}`	Set the compression level for the file to be compressed.	No default.
`content-type "<content-type_name>"`	Enter one of the following content types to compress it: • `text/plain` • `text/html` • `application/xml(or)text/xml` • `application/soap+xml` • `application/x-javascript` • `text/css` • `application/javascript` • `text/javascript` • `application/json` • `application/rss+xml` To compress multiple file types, add each file type in a separate table entry with its own `<entry_index>` (page 393). See "Example" on page 394.	No default.
`exclude-url "<exclusion-rule_name>"`	Enter the name of an exclusion to use with the rule, if any. For details, see "waf exclude-url" on page 391. The maximum length is 63 characters.	No default.

Example

This example configures a file compression rule that compresses CSS and HTML files, unless they match one of the URLs in the exception named “Compression Exclusion 1.”

```
config waf file-compress-rule
   edit "file-compress-rule_name"
      set compression-type gzip
      set compression-level level2
      set content-types
           edit 1
              set content-type text/css
           next
           edit 2
              set content-type text/html
           next
        end
      set exclude-url "Compression Exclusion 1"
   next
end
```

waf file-upload-restriction-policy

Use this command to set file security policies that FortiWeb will use to manage the types of files that can be uploaded to your web servers.

The policies are composed of individual rules set using the `config server-policy custom-application application-policy` (page 1) command. Each rule identifies the host and/or URL to which the restriction applies and the types of files allowed. To apply a file security policy, select it within an inline or Offline Protection profile.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf file-upload-restriction-policy
   edit "<file-upload-restriction-policy_name>"
      set action {alert | alert_deny | block-period | deny_no_log}
      set block-period <seconds_int>
      set severity {High | Medium | Low | Info}
      set trigger <trigger-policy_name>
      set trojan-detection {enable | disable}
      set av-scan {enable | disable}
      set fortisandbox-check {enable | disable}
      set hold-session-while-scanning-file {enable | disable}
      set exchange-mail-detection {enable | disable}
      set owa-protocol {enable | disable}
      set activesync-protocol {enable | disable}
      set mapi-protocol {enable | disable}
      config rule
         edit <entry_index>
            set file-upload-restriction-rule <rule_name>
         next
      end
   next
end
```

Variable	Description	Default
"<file-upload-restriction-policy_name>"	Enter the name of an existing or new file security policy. The maximum length is 63 characters. To display the list of existing policies, enter: `edit ?`	No default.
action {alert | alert_deny | block-period |	Enter the action you want FortiWeb to perform when the policy is violated:	alert

Variable	Description	Default
deny_no_log}	• alert—Accept the request and generate an alert and/or log message. • alert_deny—Block the request (or reset the connection) and generate an alert email and/or log message. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296 and the *FortiWeb Administration Guide*: http://docs.fortinet.com/fortiweb/admin-guides • block-period—Block subsequent requests from the client for a number of seconds. Also configure block-period <seconds_int> (page 396). • deny_no_log—Deny a request. Do not generate a log message. **Note:** If FortiWeb is deployed behind a NAT load balancer, when using this option, you **must** also define an X-header that indicates the original client's IP. Failure to do so may cause FortiWeb to block **all** connections when it detects a violation of this type. For details, see "waf x-forwarded-for" on page 551. **Caution:** This setting will be ignored if monitor-mode {enable | disable} (page 146) is enabled. **Note:** Logging and/or alert email will occur only if enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71. **Note:** If an auto-learning profile will be selected in the policy with Offline Protection profiles that use this rule, you should select alert. If the action is alert_deny, the FortiWeb appliance will reset the connection when it detects an attack, resulting in incomplete session information for the auto-learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	
block-period <seconds_int>	If action {alert | alert_deny | block-period | deny_no_log} (page 395) is block-period, type the number of seconds that violating requests will be blocked. The valid range is 1–3,600.	1
severity {High | Medium | Low | Info}	Select the severity level to use in logs and reports generated when a violation of the rule occurs.	Low

Variable	Description	Default
`trigger <trigger-policy_name>`	Enter the name of the trigger to apply when this policy is violated. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing triggers, enter: `set trigger ?`	No default.
`trojan-detection {enable | disable}`	Enter `enable` to scan for Trojans. Attackers may attempt to upload Trojan horse code (written in scripting languages such as PHP and ASP) to the back-end web servers. The Trojan then infects clients who access an infected web page.	`disable`
`av-scan {enable | disable}`	Enter `enable` to scan for viruses, malware, and greyware.	`disable`
`fortisandbox-check {enable | disable}`	Enter `enable` to send matching files to FortiSandbox for evaluation. Also specify the FortiSandbox settings for your FortiWeb. For details, see "system fortisandbox" on page 252. FortiSandbox evaluates the file and returns the results to FortiWeb. If `trojan-detection {enable | disable}` (page 397) is `enable` and FortiWeb detects a virus, it does not send the file to FortiSandbox.	`disable`
`exchange-mail-detection {enable | disable}`	Enter `enable` so that FortiWeb will scan email attachments in applications using OWA or ActiveSync protocols. If enabled, FortiWeb will perform Trojan detection, an antivirus scan, and will send the attachments to FortiSandbox. **Note**: To perform Trojan detection, an antivirus scan, and send attachments to FortiSandbox, you must enable `trojan-detection {enable | disable}` (page 397), `trojan-detection {enable | disable}` (page 397), and `fortisandbox-check {enable | disable}` (page 397), respectively, in the file security policy.	`disable`
`owa-protocol {enable | disable}`	Available only when `exchange-mail-detection {enable | disable}` (page 397) is set to `enable`. If enabled, FortiWeb will scan attachments in Exchange Email sent and received via a web browser login.	`disable`
`activesync-protocol {enable | disable}`	Available only when `exchange-mail-detection {enable | disable}` (page 397) is set to `enable`. If enabled, FortiWeb	`disable`

Variable	Description	Default
	will scan attachments in Exchange Email sent and received via a mobile phone login.	
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`file-upload-restriction-rule <rule_name>`	Enter the name of an upload restriction rule to use with the policy, if any. For details, see "server-policy custom-application application-policy" on page 1. The maximum length is 63 characters. To display the list of existing rules, enter: `set file-upload-restriction-rule ?`	No default.
`hold-session-while-scanning-file {enable | disable}`	Enable it, and FortiWeb waits for up to 30 minutes. If FortiWeb holds the session for over 30 minutes while FortiSandbox scans the file in the request, FortiWeb will forward the session without taking any other actions. This option is available only when you enable Send files to FortiSandbox.	`disable`
`mapi-protocol {enable | disable}`	FortiWeb will scan attachments in Email sent and received via the Messaging Application Programming Interface (MAPI), a new transport protocol implemented in Microsoft Exchange Server 2013 Service Pack 1 (SP1). Available only when Scan attachments in Email is enabled.	`disable`

waf file-upload-restriction-rule

Use this command to define the specific host and request URL for which file upload restrictions apply, and define the specific file types that can be uploaded to that host or URL.

To apply the rule, select it in a file security policy. For details, see "waf file-upload-restriction-policy" on page 395.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf file-upload-restriction-rule
  edit "<file-upload-restriction-rule_name>"
```

```
        set host-status {enable | disable}
        set host "<protected-host_name>"
        set request-file "<url_pattern>"
        set request-type {regular | plain}
        [set file-size-limit <size_int>]
        config file-types
           edit <entry_index>
              set file-type-id "<id_str>"
              set file-type_name "<file-type-extension_str>"
           next
        end
     next
  end
```

Variable	Description	Default
"<file-upload-restriction-rule_name>"	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.
host-status {enable | disable}	Enable to apply this exception only to HTTP requests for specific web hosts. Disable to match the exception based upon the other criteria, such as the URL, but regardless of the `Host:` field.	disable
host "<protected-host_name>"	Enter the name of a protected host that the `Host:` field of an HTTP request must be in order to match the rule. The maximum length is 255 characters. This setting applies only if `host-status {enable | disable}` (page 399) is `enable`.	No default.
request-file "<url_pattern>"	Depending on your selection in `request-type {regular | plain}` (page 400), type either: • The literal URL, such as `/fileupload`, that the HTTP request must contain in order to match the signature exception. The URL must begin with a slash (/). • A regular expression, such as `^/*.php`, matching all and only the URLs to which the signature exception should apply. The pattern is **not** required to begin with a slash (/). However, it must at least match URLs that begin with a slash, such as `/index.cfm`. Do not include the name of the web host, such as `www.example.com`, which is configured separately in `analyzer-policy "<fortianalyzer-policy_name>"` (page 106). The maximum length is 255 characters.	No default.

Variable	Description	Default
	Note: Regular expressions beginning with an exclamation point (`!`) are not supported. For information on language and regular expression matching, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides	
`request-type {regular | plain}`	Select whether `analyzer-policy "<fortianalyzer-policy_name>"` (page 106) will contain a literal URL (`plain`), or a regular expression designed to match multiple URLs (`regular`).	`plain`
`file-size-limit <size_int>`	Optionally, enter a number to represent the maximum size in kilobytes for any individual file. This places a size limit on allowed file types. The valid range is 0–30720 KB.	`0`
`<entry_index>`	Enter the index number of the individual entry in the table. Each entry in the table can define one file type. The valid range is 1–9,999,999,999,999,999,999.	No default.
`file-type-id "<id_str>"`	Select the numeric type ID that corresponds to the file type. Recognized IDs are updated by FortiGuard services and may vary. For a list of available IDs, select all file types in the GUI, then use the CLI to view their corresponding IDs. Common IDs include: • 00001 (GIF) • 00002 (JPG) • 00003 (PDF) • 00004 (XML) • 00005 (MP3) • 00006 (MIDI) • 00007 (WAVE) • 00008 (FLV for a Macromedia Flash Video) • 00009 (RAR) • 00010 (ZIP) • 00011 (BMP) • 00012 (RM for RealMedia) • 00013 (MPEG for MPEG v) • 00014 (3GPP)	No default.

Variable	Description	Default
`file-type_name "<file-type-extension_str>"`	Enter the extension, such as `MP3`, of the file type to allow to be uploaded. Recognized file types are updated by FortiGuard services and may vary. For a list of available names, use the GUI. **Note:** Microsoft Office Open XML file types such as .docx, xlsx, .pptx, and .vsdx are a type of ZIP-compressed XML. If you specify restrictions for them, those signatures will take priority. However, if you do **not** select a MSOOX restriction but **do** have an XML or ZIP restriction, the XML and ZIP restrictions will still apply, and the files will still be restricted.	No default.

Example

This example allows both MPEG and FLV files uploaded to the URL `/file-uploads` on the host `www.example.com`.

```
config waf file-upload-restriction-rule
   edit "file-upload-rule1"
      set host-status enable
      set host "www.example.com"
      set request-file "/file-uploads"
      config file-types
         edit 1
            set file-type-id "00013"
            set file-type-name "MPEG"
         next
         edit 2
            set file-type-id "00008"
            set file-type-name "FLV"
         next
      end
   next
end
```

- "server-policy custom-application application-policy" on page 1

waf ftp-command-restriction-rule

Use this command to create FTP command restriction rules to specify acceptable FTP commands that clients can use to communicate with your server(s). Certain FTP commands can expose your server(s) to attack. For example, because attackers can exploit the `PORT` command to carry out FTP bounce attacks, restricting the `PORT` command can harden your network's security if you're using FTP.

For details about applying an FTP command restriction rule to an FTP server policy, see waf ftp-propredefined-global-white-listtection-profile.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

If `ftp-security` isn't enabled in `feature-visibility`, you must enable it before you can create an FTP command restriction rule. To enable `ftp-security`, see "system feature-visibility" on page 242.

Syntax

```
config waf ftp-command-restriction-rule
   edit "<rule_name>"
      set action {alert | alert_deny | block-period | deny_no_log}
      set block-period <block_period_int>
      set severity {High | Info | Low | Medium}
      set trigger "<policy_name>"
         next
      end
      config command-types
         edit <entry_index>
            set command-type <ftp_command>

         next
      end
```

Variable	Description	Default
`"<rule_name>"`	Enter a unique name that can be referenced in other parts of the configuration. Don't use spaces or special characters. The maximum length is 63 characters.	No default.
`<entry_index>`	Enter an index number of the individual entry in the table. The valid range is 1–999,999,999,999,999,999. You must create an entry index for each FTP command that you plan to include in the rule.	No default.
`command-type <ftp_command>`	Enter an FTP command that you want to include in the rule. You can include these FTP commands in the rule: • ABOR • ACCT • ALLO • APPE • AUTH • CDUP • CWD • DELE • MLSD • MODE • NLST • OPTS • PASS • PASV • PORT • PROT • RNTO • SITE • SIZE • SMNT • STAT • STOR • STOU • STRU	No default.

Variable	Description	Default
	• EPRT • EPSV • FEAT • HELP • LIST • MDTM • MKD • PWD • QUIT • REIN • REST • RETR • RMD • RNFR • SYST • TYPE • USER • XCUP • XMKD • XPWD • XRMD	
`action {alert | alert_deny | block-period | deny_no_log}`	Select which action FortiWeb will take when it detects a violation of the rule: • `alert`—Accept the connection and generate an alert email and/or log message. • `alert_deny`—Block the request (or reset the connection) and generate an alert and/or log message. • `deny_no_log`—Block the request (or reset the connection). • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure **waf ftp-command-restriction-rule** (page 401). **Note:** This setting will be ignored if "server-policy policy" on page 146is enabled in a server policy.	`alert`
`block-period <block_period_int>`	Enter the number of seconds that you want to block subsequent requests from a client after FortiWeb detects that the client has violated the rule. The valid range is 1–3,600. This setting is available only if **action {alert | alert_deny | block-period | deny_no_log}** (page 403) is set to `block-period`.	`60`
`severity {High | Info | Low | Medium}`	When rule violations are recorded in the attack log, each log message contains a **Severity Level** (`severity_level`) field. Select which severity level FortiWeb will use when it logs a violation of the rule: • `Info` • `Low` • `Medium` • `High`	`Medium`
`trigger "<policy_name>"`	Enter the name of a trigger policy, if any, that FortiWeb will use when it logs and/or sends an alert email about a violation of the rule.	No default.

- "waf ftp-file-security" on page 404

waf ftp-file-security

Use this command to create FTP file check rules so that FortiWeb places restrictions on uploading or downloading files and scans files that clients attempt to upload to or download from your server(s). When configured, FortiWeb can also send files to FortiSandbox for analysis and perform an antivirus scan.

For details about applying an FTP file check rule to an FTP server policy, see waf ftp-propredefined-global-white-listtection-profile.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

If `ftp-security` isn't enabled in `feature-visibility`, you must enable it before you can create an FTP file check rule. To enable `ftp-security`, see "system feature-visibility" on page 242.

Syntax

```
config waf ftp-file security
   edit "<rule_name>"
      set action {alert | alert_deny | block-period | deny_no_log}
      set block-period <block_period_int>
      set severity {High | Info | Low | Medium}
      set trigger "<policy_name>"
      set check-dir {both | download | upload}
      set "waf ftp-file-security" on page 405
      set send-files-to-fortisandbox {enable | disable}

   next
end
```

Variable	Description	Default
`"<rule_name>"`	Enter a unique name that can be referenced in other parts of the configuration. Don't use spaces or special characters. The maximum length is 63 characters.	No default.
`action {alert | alert_deny | block-period | deny_no_log}`	Select which action FortiWeb will take when it detects a violation of the rule: • `alert`—Accept the connection and generate an alert	`alert_deny`

Variable	Description	Default
	email and/or log message. • `alert_deny`—Block the request (or reset the connection) and generate an alert and/or log message. • `deny_no_log`—Block the request (or reset the connection). • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure **waf ftp-file-security** (page 404). **Note:** This setting will be ignored if `monitor-mode {enable | disable}` (page 146) is enabled in a server policy.	
`block-period <block_period_int>`	Enter the number of seconds that you want to block subsequent requests from a client after FortiWeb detects that the client has violated the rule. The valid range is 1–3,600. This setting is available only if **waf ftp-file-security** (page 404) is set to `block-period`.	`60`
`severity {High | Info | Low | Medium}`	When rule violations are recorded in the attack log, each log message contains a **Severity Level** (`severity_level`) field. Select which severity level FortiWeb will use when it logs a violation of the rule: • `Info` • `Low` • `Medium` • `High`	`Medium`
`trigger "<policy_name>"`	Enter the name of a trigger policy, if any, that FortiWeb will use when it logs and/or sends an alert email about a violation of the rule.	No default.
`check-dir {both | download | upload}`	Select one of the following: • `both`—FortiWeb applies the rule to files being either downloaded from or uploaded to your server(s). • `download`—FortiWeb applies the rule to files being downloaded from your server(s). • `upload`—FortiWeb applies the rule to files being uploaded to your server(s).	`upload`
`av-scan {enable | disable}`	Enable so that FortiWeb performs an antivirus scan on files that match the `waf ftp-file-security` (page	`disable`

Variable	Description	Default
	404).	
`send-files-to-fortisandbox {enable | disable}`	Enable so that FortiWeb sends files to FortiSandbox that match the `waf ftp-file-security` (page 404). Also specify the FortiSandbox settings for your FortiWeb. For details, see "system fortisandbox" on page 252. FortiSandbox evaluates the file and returns the results to FortiWeb. If `waf ftp-file-security` (page 404) is enabled and FortiWeb detects a virus, it does not send the file to FortiSandbox.	disable

- waf ftp-propredefined-global-white-listtection-profile

waf geo-block-list

Use this command to define large sets of client IP addresses to block based upon their associated geographical location.

Because network mappings may change as networks grow and shrink, if you use this feature, be sure to periodically update the geography-to-IP mapping database. To download the file, go to the Fortinet Customer Service & Support website:

https://support.fortinet.com

Optionally, you can also specify a list of IP addresses or IP address ranges that are exempt from this blacklist. For details, see "waf geo-ip-except" on page 408.

Alternatively, you can block clients individually (see "server-policy custom-application application-policy" on page 1) or based upon their reputation (see "waf ip-intelligence" on page 441).

To apply the rule, select it in a protection profile. For details, see "waf web-protection-profile inline-protection" on page 528 or "waf web-protection-profile offline-protection" on page 541.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf geo-block-list
  edit "<geography-to-ip_name>"
    set severity {High | Medium | Low | Info}
```

```
      set trigger "<trigger-policy_name>"
      set exception-rule "<geo-ip-except_name>"
      config country-list
        edit <entry_index>
          set country-name "<region_name>"
        next
      end
    next
end
```

Variable	Description	Default
"<geography-to-ip_name>"	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.
severity {High | Medium | Low | Info}	Select the severity level to use in logs and reports generated when a violation of the rule occurs.	Low
trigger "<trigger-policy_name>"	Enter the name of the trigger to apply when this rule is violated. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
exception-rule "<geo-ip-except_name>"	Enter the name of a list of exceptions to this blacklist.	No default.
<entry_index>	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
country-name "<region_name>"	Enter the name of a region (`Antarctica` or `Bouvet Island`) or country (`U.S.`) as it is written in English. Surround names with multiple words or apostrophes in double quotes. The list of locations varies by the currently installed IP-to-geography mapping package. For a current list of locations, use the web UI.	No default.

Example

This example creates a set of North American IP addresses that a server policy can use to block clients with IP addresses belonging to Belize and Canada. FortiWeb does not block the IP addresses specified by the `allow-north-america` exception list.

```
config waf geo-block-list
  edit "north-america"
    set trigger "notification-servers1"
```

```
      set exception rule "allow-north-america"
      set severity Low
      config country-list
         edit 1
            set country-name "Belize"
         next
         edit 2
            set country-name "Canada"
         next
      end
   next
end
```

waf geo-ip-except

Use this command to specify IP addresses or ranges of IP addresses that are exceptions to the list of client IP addresses that FortiWeb blocks based on their geographic location.

For details about creating the blacklist by country or region, see "waf geo-block-list" on page 406.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf geo-ip-except
   edit "<geo-ip-except_name>"
        edit <entry_index>
           set ip {"<address_ipv4>" | "<ip_range_ipv4>"}
        next
      end
   next
end
```

Variable	Description	Default
`"<geo-ip-except_name>"`	Enter the name of a new or existing list of exceptions. To display the list of existing rules, enter: `edit ?`	No default.

Variable	Description	Default
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`ip {"<address_ipv4>" | "<ip_range_ipv4>"}`	Enter the IP address or IP address range that is exempt from blocking based on its geographic location.	No default.

Example

This example adds the IP address range 192.0.2.0 to 192.0.2.5 to the geo-location blacklist exception list `allow-north-america`.

```
config waf geo-ip-except
   edit "allow-north-america"
      set ip "92.0.2.0-192.0.2.5"
      end
   next
end
```

waf hidden-fields-protection

Use this command to configure groups of hidden field rules.

To apply hidden field rule groups, select them within an inline protection profile. For details, see "waf web-protection-profile inline-protection" on page 528.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf hidden-fields-protection
   edit "<hidden-field-group_name>"
      config hidden_fields_list
         edit <entry_index>
            set hidden-field-rule "<hidden-field-rule_name>"
         next
      end
   next
end
```

Variable	Description	Default
"<hidden-field-group_name>"	Enter the name of a new or existing hidden field rule group. The maximum length is 63 characters. To display the list of existing groups, enter: `edit ?`	No default.
<entry_index>	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
hidden-field-rule "<hidden-field-rule_name>"	Enter the name of an existing hidden field rule to add to the group. The maximum length is 63 characters. To display the list of existing rules, enter: `set hidden-field-rule ?`	No default.

waf hidden-fields-rule

Use this command to configure hidden field rules.

Hidden form inputs, like other types of parameters and inputs, can be vulnerable to tampering and can be used as a vector for other attacks.

Unlike other inputs, they are often written into an HTML page by the web server when it serves that page to the client, and are not visible on the rendered web page. As such, they are difficult to for users to unintentionally modify, and are often incorrectly perceived as relatively safe by website owners.

Like other inputs, however, they are accessible through the JavaScript document object model (DOM), and as inputs, can be used to inject invalid data into your databases or attempt to tamper with the session state.

Hidden field rules prevent such tampering. The FortiWeb appliance caches the values of a session's hidden inputs as they pass to the HTTP client, and verifies that they remain unchanged when the HTTP client submits a form.

You apply hidden field constraints by first grouping them into a hidden field group. For details, see "waf hidden-fields-protection" on page 409.

Before you configure a hidden field rule, if you want to apply it only to HTTP requests for a specific real or virtual host, you must first define the web host in a protected hosts group. For details, see "server-policy allow-hosts" on page 112.

Alternatively, you can use the web UI to fetch the request URL from the server and scan it for hidden inputs, using the results to configure the hidden input rule. For details, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf hidden-fields-rule
   edit "<hidden-field-rule_name>"
      set action {alert | alert_deny | redirect | block-period | send_403_forbidden |
          deny_no_log}
      set block-period <seconds_int>
      set host "<protected-hosts_name>"
      set host-status {enable | disable}
      set request-file "<url_str>"
      set action-url0 "<url_str>"
      set action-url1 "<url_str>"
      set action-url2 "<url_str>"
      set action-url3 "<url_str>"
      set action-url4 "<url_str>"
      set action-url5 "<url_str>"
      set action-url6 "<url_str>"
      set action-url7 "<url_str>"
      set action-url8 "<url_str>"
      set action-url9 "<url_str>"
      set severity {High | Medium | Low | Info}
      set trigger "<trigger-policy_name>"
      config hidden-field-name
         edit <entry_index>
            set argument "<hidden-field_str>"
         next
      end
   next
end
```

Variable	Description	Default
`"<hidden-field-rule_name>"`	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.
`action {alert | alert_deny | redirect | block-period | send_403_forbidden | deny_no_log}`	Select one of the following actions that the FortiWeb appliance will perform when an HTTP request violates one of the hidden field rules in the entry: • `alert`—Accept the request and generate an alert email and/or log message. • `alert_deny`—Block the request (or reset the connection) and generate an alert email and/or log message. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see	`alert`

Variable	Description	Default
	"system replacemsg" on page 296. • block-period—Block subsequent requests from the client for a number of seconds. Also configure block-period <seconds_int> (page 437). **Note:** If FortiWeb is deployed behind a NAT load balancer, when using this option, you **must** also define an X-header that indicates the original client's IP. Failure to do so may cause FortiWeb to block **all** connections when it detects a violation of this type. For details, see "waf x-forwarded-for" on page 551. • redirect—Redirect the request to the URL that you specify in the protection profile and generate an alert email and/or log message. Also configure redirect-url "<redirect_fqdn>" (page 539) and rdt-reason {enable | disable} (page 539). • send_403_forbidden—Reply to the client with an HTTP 403 Access Forbidden error message and generate an alert email and/or log message. • deny_no_log—Deny a request. Do not generate a log message. • block-period—Block subsequent requests from the client for a number of seconds. **Caution:** This setting will be ignored if monitor-mode {enable | disable} (page 146) is enabled. **Note:** Logging and/or alert email will occur only if enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71. **Note:** If you select an auto-learning profile with this rule, you should select alert. If the action is alert_deny, for example, the FortiWeb appliance will block the request or reset the connection when it detects an attack, resulting in incomplete session information for the auto-learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	
block-period <seconds_int>	If action {alert | alert_deny | redirect | block-period | send_403_forbidden | deny_no_log} (page 411) is block-period, enter the number of seconds that the connection will be blocked. The valid range is 1–3,600.	0
host "<protected-hosts_name>"	Enter the name of a protected host that the Host: field of an HTTP request must be in order to match the rule. The	No default.

Variable	Description	Default
	maximum length is 255 characters. This setting applies only if `host-status {enable | disable}` (page 413) is `enable`.	
`host-status {enable | disable}`	Enable to apply this hidden field rule only to HTTP requests for specific web hosts. Also configure `host "<protected-hosts_name>"` (page 412). Disable to match the input rule based upon the other criteria, such as the URL, but regardless of the `Host:` field.	`disable`
`request-file "<url_str>"`	Enter the literal URL, such as `/login.jsp`, that contains the hidden form. The URL must begin with a slash (/). Do not include the name of the web host, such as `www.example.com`, which is configured separately in `host "<protected-hosts_name>"` (page 412). Regular expressions are not supported. The maximum length is 255 characters.	No default.

`action-url0 "<url_str>"`
`action-url1 "<url_str>"`
`action-url2 "<url_str>"`
`action-url3 "<url_str>"`
`action-url4 "<url_str>"`
`action-url5 "<url_str>"`
`action-url6 "<url_str>"`
`action-url7 "<url_str>"`
`action-url8 "<url_str>"`
`action-url9 "<url_str>"`
	Add up to 10 URLs that are valid to use with the HTTP `POST` method when the client submits the form containing the hidden fields in this rule.	No default.

`severity {High | Medium | Low | Info}`	Select the severity level to use in logs and reports generated when a violation of the rule occurs.	`High`
`trigger "<trigger-policy_name>"`	Enter the name of the trigger to apply when this rule is violated. For details, see `log trigger-policy` (page 105). The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.

Variable	Description	Default
<entry_index>	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
argument "<hidden-field_str>"	Enter the name of the hidden form input, such as languagepref. The maximum length is 63 characters.	No default.

Example

This example blocks and logs requests from search.jsp if its hidden form input, whose name is “languagepref”, is posted to any URL other than query.do.

```
config waf hidden-fields-rule
   edit "hidden_fields_rule1"
      set action alert_deny
      set request-file "/search.jsp"
      set action-url0 "/query.do"
      config hidden-field-name
         edit 1
            set argument "languagepref"
         next
      end
   next
end
```

waf http-authen http-authen-policy

Use this command to group HTTP authentication rules into HTTP authentication policies.

The FortiWeb appliance uses authentication policies with the HTTP authentication feature to authorize HTTP requests. For details, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To apply HTTP authentication policies, select them in an inline protection profile. For details, see "waf web-protection-profile inline-protection" on page 528.

To use this command, your administrator account’s access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf http-authen http-authen-policy
   edit "<auth-policy_name>"
```

```
        set cache {enable | disable}
        set alert-type {none | fail | success | all}
        set cache-timeout <timeout_int>
        set auth-timeout <timeout_int>
        config rule
          edit <entry_index>
            set http-authen-rule "<http-auth-rule_name>"
          next
        end
      next
    end
```

Variable	Description	Default
"<auth-policy_name>"	Enter the name of a new or existing HTTP authentication policy. The maximum length is 63 characters. To display the list of existing policies, enter: edit ?	No default.
cache {enable | disable}	Enable to cache client user names and passwords from remote authentication such as LDAP queries. Also configure cache-timeout <timeout_int> (page 415). This can be used can improve performance by preventing frequent queries.	No default.
alert-type {none | fail | success | all}	Enter the instances when alerts will be issued for HTTP authentication attempts: • none—No alerts are issued for HTTP authentication. • fail—Alerts are issued only for HTTP authentication failures. • success—Alerts are issued for successful HTTP authentication. • all—Alerts are issued for all failed and successful HTTP authentication.	none
cache-timeout <timeout_int>	Enter the query cache timeout, in seconds. The valid range is 0–3,600. This option is available only when cache {enable | disable} (page 415) is enabled.	300
auth-timeout <timeout_int>	Enter the connection timeout (in milliseconds) for the query to the FortiWeb's query to the remote authentication server in milliseconds. The valid range is 0–60,000. To prevent dropped connections if the authentication server does not answer queries quickly enough, increase this value.	2000
<entry_index>	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.

Variable	Description	Default
`http-authen-rule "<http-auth-rule_name>"`	Enter the name of an existing HTTP authentication rule. The maximum length is 63 characters. To display the list of existing rules, enter: `set http-authen-rule ?`	No default.

Example

This example first configures a user group that contains both a local user account and an LDAP query.

```
config user user-group
   edit "user-group1"
      config members
         edit 1
            set type local
            set local-name "user1"
         next
         edit 2
            set ldap-name "user2"
            set type ldap
         next
      end
   next
end
```

Second, it configures a rule that requires basic HTTP authentication when requesting the URL `/employees/holidays.html` on the host `www.example.com`. This URL will be identified as belonging to the realm named “Restricted Area”. Users belonging to `user-group1` can authenticate.

```
config waf http-authen http-authen-rule
   edit "auth-rule1"
      set host-status enable
      set host "www.example.com"
      config rule
         edit 1
            set request-url "/employees/holidays.html"
            set authen-type basic
            set user-group "user-group1"
            set user-realm "Restricted Area"
         next
      end
   next
end
```

Third, it groups two HTTP authentication rules into an HTTP authentication policy that can be applied in an inline protection profile.

```
config waf http-authen http-authen-policy
   edit "http-auth-policy1"
      config rule
         edit 1
            set http-authen-rule "http-auth-rule1"
         next
```

```
        edit 2
          set http-authen-rule "http-auth-rule2"
        next
      end
    next
  end
```

Related topics

- "waf http-authen http-authen-rule" on page 417
- "waf web-protection-profile inline-protection" on page 528

waf http-authen http-authen-rule

Use this command to configure HTTP authentication rules.

Authentication rules are used by the HTTP authentication feature to define sets of request URLs that will be authorized for each user group.

You apply authentication rules by adding them to an authentication policy, which is ultimately selected within an inline protection profile for use in web protection. For details, see "waf http-authen http-authen-policy" on page 414.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf http-authen http-authen-rule
  edit "<auth-rule_name>"
    set host "<protected-hosts_name>"
    set host-status {enable | disable}
    config rule
      edit <entry_index>
        set authen-type {basic | digest | ntlm}
        set request-url "<path_str>"
        set user-group "<user-group_name>"
        set user-realm "<realm_str>"
      next
    end
  next
end
```

Variable	Description	Default
`"<auth-rule_name>"`	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.

Variable	Description	Default
`host "<protected-hosts_name>"`	Enter the name of a protected host that the `Host:` field of an HTTP request must be in order to match the HTTP authentication rule. The maximum length is 255 characters. This setting applies only if `host-status` is `enable`.	No default.
`host-status {enable | disable}`	Enable to apply this HTTP authentication rule only to HTTP requests for specific web hosts. Also configure `host "<protected-hosts_name>"` (page 418). Disable to match the HTTP authentication rule based upon the other criteria, such as the URL, but regardless of the `Host:` field.	`disable`
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`authen-type {basic | digest | ntlm}`	Select which type of HTTP authentication to use, either: • `basic`—Clear text, Base64-encoded user name and password. Supports local user accounts, and RADIUS and LDAP user queries. NTLM user queries are not supported. • `digest`—Hashed user name, realm, and password. RADIUS, LDAP and NTLM user queries are not supported. • `ntlm`—Encrypted user name and password. Local user accounts and RADIUS and LDAP user queries are not supported.	`basic`
`request-url "<path_str>"`	Enter the literal URL, such as `/employees/holidays.html`, that a request must match in order to trigger HTTP authentication. The maximum length is 255 characters.	No default.
`user-group "<user-group_name>"`	Enter the name of a user group that is authorized to use the URL in `request-url "<path_str>"` (page 418). The maximum length is 63 characters. To display the list of existing user groups, enter: `set user-group ?`	No default.
`user-realm "<realm_str>"`	Enter the realm, such as `Restricted Area`, to which the `request-url "<path_str>"` (page 418) belongs. The maximum length is 63 characters. Browsers often use the realm multiple times. • It may appear in the browser's prompt for the user's credentials. Especially if a user has multiple logins, and only one login is valid for that specific realm, displaying the realm helps to indicate which user name and password should be supplied. • After authenticating once, the browser may cache the authentication credentials for the duration of the browser session. If the user requests	No default.

Variable	Description	Default
	another URL from the same realm, the browser often will automatically re-supply the cached user name and password, rather than asking the user to enter them again for each request. The realm may be the same for multiple authentication rules, if all of those URLs permit the same user group to authenticate. For example, the user group `All_Employees` could have access to the `request-url "<path_str>"` (page 418) URLs `/wiki/Main` and `/wiki/ToDo`. These URLs both belong to the realm named `Intranet Wiki`. Because they use the same realm name, users authenticating to reach `/wiki/Main` usually will not have to authenticate again to reach `/wiki/ToDo`, as long as both requests are within the same browser session. This field does not appear if `authen-type` is `ntlm`, which does not support HTTP-style realms.	

Example

For an example, see "waf http-authen http-authen-policy" on page 414.

waf http-connection-flood-check-rule

Use this command to limit the number of TCP connections per HTTP session. This can prevent TCP connection floods from clients operating behind a shared IP with innocent clients.

Excessive numbers of TCP connections per session can occur if a web application or client is malfunctioning, or if an attacker is attempting to waste socket resources to produce a DoS.

This command is similar to "waf layer4-connection-flood-check-rule" on page 450. However, this feature counts TCP connections per session cookie, while TCP flood prevention counts only TCP connections per IP address. Because it uses session cookies at the application layer instead of only TCP/IP connections at the network layer, this feature can differentiate multiple clients that may be behind the same source IP address, such as when the source IP address hides a subnet that uses network address translation (NAT). However, in order to work, the client must support cookies.

To apply this rule, include it in an application-layer DoS-prevention policy. For details, see "waf application-layer-dos-prevention" on page 344.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf http-connection-flood-check-rule
   edit "<rule_name>"
      set action {alert | alert_deny | block-period | deny_no_log}
      set block-period <seconds_int>
      set http-connection-threshold <limit_int>
      set severity {High | Medium | Low | Info}
      set trigger-policy "<trigger-policy_name>"
   next
end
```

Variable	Description	Default
"<rule_name>"	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: edit ?	No default.
action {alert | alert_deny | block-period | deny_no_log}	Select one of the following actions that the FortiWeb appliance will perform when the count exceeds the rate limit: • alert—Accept the connection and generate an alert email and/or log message. • alert_deny—Block the connection and generate an alert email and/or log message. • block-period—Block subsequent requests from the client for a number of seconds. Also configure block-period <seconds_int> (page 420). • deny_no_log—Deny a request. Do not generate a log message. **Caution:** This setting will be ignored if monitor-mode {enable | disable} (page 146) is enabled. **Note:** Logging and/or alert email will occur only if enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71. **Note:** If an auto-learning profile will be selected in the policy with Offline Protection profiles that use this rule, you should select alert. If the action is alert_deny, the FortiWeb appliance will reset the connection when it detects an attack, resulting in incomplete session information for the auto-learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	alert
block-period <seconds_int>	Enter the length of time (in seconds) for which the FortiWeb appliance will block additional requests after a client exceeds	1

Variable	Description	Default
	the rate threshold. The valid range is 1–3,600.	
`http-connection-threshold <limit_int>`	Enter the maximum number of TCP connections allowed from the same client. The valid range is 1–1,024.	1
`severity {High | Medium | Low | Info}`	Select the severity level to use in logs and reports generated when a violation of the rule occurs.	Medium
`trigger-policy "<trigger-policy_name>"`	Enter the name of the trigger to apply when this rule is violated. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.

Related topics

waf http-constraints-exceptions

Use set statements under this command to configure exceptions to existing HTTP protocol parameter constraints for specific hosts.

Exceptions may be useful if you know that some HTTP protocol constraints, during normal use, will cause false positives by matching an attack signature. Exceptions define HTTP constraints that will **not** be subject to HTTP protocol constraint policy.

For example, if you enable `max-http-header-length` in a HTTP protocol constraint exception for a specific host, FortiWeb ignores the HTTP header length check when executing the web protection profile for that host.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf http-constraints-exceptions
   edit "<http-exception_name>"
      config http_constraints-exception-list
         edit <entry_index>
            set request-file "<url_pattern>"
            set request-type {plain | regular}
            set host-status {enable | disable}
            set block-malformed-request {enable | disable}
            set Illegal-content-length-check {enable | disable}
```

```
            set Illegal-content-type-check {enable | disable}
            set Illegal-header-name-check {enable | disable}
            set Illegal-header-value-check {enable | disable}
            set Illegal-host-name-check {enable | disable}
            set Illegal-http-request-method-check {enable | disable}
            set Illegal-responese-code-check {enable | disable}
            set max-cookie-in-request {enable | disable}
            set max-header-line-request {enable | disable}
            set max-http-body-length {enable | disable}
            set max-http-body-parameter-length {enable | disable}
            set max-http-content-length {enable | disable}
            set max-http-header-length {enable | disable}
            set max-http-header-line-length {enable | disable}
            set max-http-header-name-length {enable | disable}
            set max-http-header-value-length {enable | disable}
            set max-http-parameter-length {enable | disable}
            set max-http-request-filename-length {enable | disable}
            set max-http-request-length {enable | disable}
            set max-url-param-name-len {enable | disable}
            set max-url-param-value-len {enable | disable}
            set max-url-parameter {enable | disable}
            set max-url-parameter-length {enable | disable}
            set number-of-ranges-in-range-header {enable | disable}
            set parameter-name-check {enable | disable}
            set parameter-value-check {enable | disable}
            set redundant-header-check {enable | disable}
            set source-ip-status {enable|disable}
            set source-ip "<ip_range>"
            set url-param-name-check {enable | disable}
            set url-param-value-check {enable | disable}
        next
    end
  next
end
```

Variable	Description	Default
"<http-exception_name>"	Enter the name of a new or existing HTTP protocol constraint exception. The maximum length is 63 characters. To display the list of existing exceptions, enter: `edit ?`	No default.
<entry_index>	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
request-file "<url_pattern>"	Enter either: • The literal URL, such as `/index.php`, that the HTTP request must contain in order to match the input rule. The URL must begin with a slash (/). • A regular expression, such as `^/*.php`, matching all and only the URLs to which the input rule should apply. The	No default.

Variable	Description	Default
	pattern is **not** required to begin with a slash (/). However, it must at least match URLs that begin with a slash, such as `/index.cfm`. Do not include the name of the web host, such as `www.example.com`, which is configured separately in `host`. The maximum length is 255 characters.	
`request-type {plain | regular}`	Enter either `plain` or `regular` (for a regular expression) to match the string entered in `request-file "<url_pattern>"` (page 422).	No default.
`host-status {enable | disable}`	Enable to apply this exception only to HTTP requests for specific web hosts. Also configure `analyzer-policy "<fortianalyzer-policy_name>"` (page 106). Disable to match the exception based upon the other criteria, such as the URL, but regardless of the `Host:` field.	`disable`
`block-malformed-request {enable | disable}`	Enable to omit the constraint on syntax and FortiWeb parsing errors. **Caution:** Some web applications require abnormal or very large HTTP POST requests. Since allowing such errors and excesses is generally bad practice and can lead to vulnerabilities, use this option to omit the malformed request scan only if absolutely necessary.	
`Illegal-content-length-check {enable | disable}`	Enable to omit the constraint on the maximum acceptable size in bytes of the request body.	`disable`
`Illegal-content-type-check {enable | disable}`	Enable to omit the constraint on whether the `Content Type:` value uses the format `<type>/<subtype>`.	`disable`
`Illegal-header-name-check {enable | disable}`	Enable to omit the constraint on whether the HTTP header name contains illegal characters.	`disable`
`Illegal-header-value-check {enable | disable}`	Enable to omit the constraint on whether the HTTP header value contains illegal characters.	`disable`
`Illegal-host-name-check {enable | disable}`	Enable to omit the constraint on host names with illegal characters.	`disable`
`Illegal-http-request-method-check {enable | disable}`	Enable to omit the constraint on illegal HTTP request methods.	`disable`
`Illegal-responese-code-check {enable | disable}`	Enable to omit the constraint on whether the HTTP response code is a 3-digit number.	`disable`

Variable	Description	Default
`max-cookie-in-request {enable | disable}`	Enable to omit the constraint on the maximum number of cookies per request.	`disable`
`max-header-line-request {enable | disable}`	Enable to omit the constraint on the maximum number of HTTP header lines.	`disable`
`max-http-body-length {enable | disable}`	Enable to omit the constraint on the maximum HTTP body length.	`disable`
`max-http-body-parameter-length {enable | disable}`	Enable to omit the constraint on the maximum acceptable size in bytes of all parameters in the HTTP body of HTTP POST requests.	`disable`
`max-http-content-length {enable | disable}`	Enable to omit the constraint on the maximum HTTP content length.	`disable`
`max-http-header-length {enable | disable}`	Enable to omit the constraint on the maximum HTTP header length.	`disable`
`max-http-header-line-length {enable | disable}`	Enable to omit the constraint on the maximum HTTP header line length.	`disable`
`max-http-header-name-length {enable | disable}`	Enable to omit the constraint on the maximum acceptable size in bytes of a single HTTP header name.	`disable`
`max-http-header-value-length {enable | disable}`	Enable to omit the constraint on the maximum acceptable size in bytes of a single HTTP header value.	`disable`
`max-http-request-filename-length {enable | disable}`	Enable to omit the constraint on the maximum HTTP request filename length.	`disable`
`max-http-parameter-length {enable | disable}`	Enable to omit the constraint on the maximum HTTP parameter length.	`disable`
`max-http-request-length {enable | disable}`	Enable to omit the constraint on the maximum HTTP request length.	`disable`
`max-url-param-name-len {enable | disable}`	Enable to omit the constraint on the maximum acceptable length in bytes of the parameter name.	`disable`
`max-url-param-value-len {enable | disable}`	Enable to omit the constraint on the maximum acceptable length in bytes of the parameter value.	`disable`
`max-url-parameter {enable | disable}`	Enable to omit the constraint on the maximum number of parameters in the URL.	`disable`

Variable	Description	Default
`max-url-parameter-length {enable | disable}`	Enable to omit the constraint on the maximum length of parameters in the URL.	`disable`
`number-of-ranges-in-range-header {enable | disable}`	Enable to omit the constraint on the maximum acceptable number of `Range:` fields of an HTTP header.	`disable`
`parameter-name-check {enable | disable}`	Enable to omit the constraint on null characters in parameter names.	`disable`
`parameter-value-check {enable | disable}`	Enable to omit the constraint on null characters in parameter values.	`disable`
`Post-request-ctype-check {enable | disable}`	Enable to omit the constraint on whether the `Content-Type:` header is available.	`disable`
`redundant-header-check {enable | disable}`	Enable to omit the constraint on the redundant instances of `Content-Length`, `Content-Type` and `Host` herder fields.	`disable`
`source-ip-status {enable|disable}`	Enable to check requests for matching the HTTP constraint exceptions rule by their source IP addresses.	`disable`
`source-ip "<ip_range>"`	Enter the source IP of the protected requests to which this exception applies. Only a single IPv4/IPv6 address, or a IPv4/IPv6 range is acceptable. For example: • `1.2.3.4` • `2001::1` • `1.2.3.4-1.2.3.40` • `2001::1-2001::100` Available only when `source-ip-status {enable|disable}` (page 425) is `enable`.	No default.
`url-param-name-check {enable | disable}`	Enable to omit the constraint on illegal characters in the parameter name.	`disable`
`url-param-value-check {enable | disable}`	Enable to omit the constraint on illegal characters in the parameter value.	`disable`

Example

This example omits header length limits for HTTP requests to `www.example.com` and `192.0.2.1` for `/login.asp`.

```
config waf http-constraints-exceptions
  edit "exception1"
    config http_constraints-exception-list
      edit 1
        set host "www.example.com"
```

```
            set host-status enable
            set max-http-header-length enable
            set request-file "/login.asp"
            next
         edit 2
            set host "192.0.2.1"
            set host-status enable
            set max-http-body-length enable
            set request-file "/login.asp"
            next
         end
   next
end
```

waf http-header-security

Use this command to insert special HTTP response headers to protect clients from certain attacks, including XSS, clickjacking, and MIME sniffing attacks. The special HTTP response headers define security policies to client browsers so that the browsers avoid exposure to known vulnerabilities when handling requests.

For more information on HTTP Header Security, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `admingrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf http-header-security
   edit "<http-header-security_name>"
      config http-header-security-list
         set name {x-content-type-options | x-frame-options | x-xss-protection | content-
             security-policy}
         set value {nosniff | allow-from | deny | sameorigin | sanitizing-mode | block-
             mode}
         set custom-value <custom-value_str>
         set allow-from-source "<allow-from_str>"
         set request-type {plain | regular}
         set request-file "<request-file_str>"
         set request-status {enable | disable}

      next
   end
   next
end
```

Variable	Description	Default
"<http-header-security_name>"	Enter of name of an HTTP header security policy. The maximum length is 63 characters.	No default.
request-status {enable | disable}	Enable to set a URL Filter.	disable
request-type {plain | regular}	Defines the Request URL Type as a simple string (plain) or a regular expression (regular) for the URL Filter. Available only if request-status {enable | disable} (page 427) is set to enable.	No default.
request-file "<request-file_str>"	Sets the Request URL for the URL Filter. Available only if request-status {enable | disable} (page 427) is set to enable.	No default.
<entry-index_int>	Creates or edits a Secure Header Rule in the selected HTTP Header Security Policy.	No default.
name {x-content-type-options | x-frame-options | x-xss-protection | content-security-policy}	Defines the Secure Header Type in the Secure Header Rule. The following options are available: • x-frame-options—Prevents browsers from **Clickjacking attacks** by providing appropriate restrictions on displaying pages in frames. • x-content-type-options—Prevents browsers from **MIME content-sniffing attacks** by disabling the browser's MIME sniffing function. • x-xss-protection—Enables a browser's built-in **Cross-site scripting (XSS)** protection.	No default.
value {nosniff | allow-from | deny | sameorigin | sanitizing-mode | block-mode}	Defines the response according to the defined Secure Header Type. The x-frame-options header can be implemented with one of the following options: • deny—The browser will not allow any frame to be displayed. • sameorigin—The browser will not allow a frame to be displayed unless the page of the frame originated from the same site. • allow-from—The browser will not allow a frame to be displayed unless the page of the frame originated from the specified domain.	No default.

Variable	Description	Default
	The `x-content-type-options` header can be implemented with one option: • `nosniff`—The browser will not guess any content type that is not explicitly specified when downloading extensions. The `x-xss-protection` header can be implemented with one of the following options: • `sanitizing-mode`—The browser will sanitize the malicious scripts when a XSS attack is detected. • `block-mode`—The browser will block the page when a XSS attack is detected.	
`allow-from-source "<allow-from_str>"`	Sets the specified domain if the `name {x-content-type-options | x-frame-options | x-xss-protection | content-security-policy}` (page 427) is `x-frame-options` and the Header Value is set to `allow-from`.	No default.
`custom-value <custom-value_str>`		

Example

This example creates a HTTP header security policy.

```
config waf http-header-security
   edit http_header_security1
      set request-status enable
      set request-type plain
      set request-file "/bWAPP/clickjacking.php"
      config http-header-security-list
         edit 1
            set name x-content-type-options
            set value nosniff
         next
         edit 2
            set name x-frame-options
            set value deny
         next
         edit 3
            set name x-xss-protection
            set value block-mode
         next
   next
end
```

waf http-protocol-parameter-restriction

Use this command to configure HTTP protocol constraints.

HTTP constraints govern features such as the HTTP header fields in the protocol itself, as well as the length of the HTML, XML, or other documents or encapsulated protocols carried in the content payload.

Use protocol constraints to prevent attacks such as buffer overflows in web servers that do not restrict elements of the HTTP protocol to acceptable lengths, or mishandle malformed requests. Such errors can lead to security vulnerabilities.

You can also use protocol constraints to block requests that are too large for the memory size you have configured for FortiWeb's scan buffers. If your web applications do not require large HTTP `POST` requests, enable `waf http-protocol-parameter-restriction` (page 429) to harden your configuration. To configure the buffer size, see `system advanced` (page 201).

You can configure each protocol parameter independently with a threat weight, action, severity, and trigger that determines how an attack on that parameter is handled. For example, you can set the action for header constraints to alert, the severity to high, and a trigger set to deliver an email each time FortiWeb detects a violation of these protocol parameters.

To apply HTTP protocol constraints, select them in an inline or Offline Protection profile. For details, see "waf web-protection-profile inline-protection" on page 528 and "waf web-protection-profile offline-protection" on page 541.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf http-protocol-parameter-restriction
   edit "<http-constraint_name>"
      set <constraint_name>-check {enable | disable}
      set <constraint_name>-action {alert | alert_deny | block-period | deny_no_log}
      set <constraint_name>-block-period <seconds_int>
      set <parameter_name>-threat-weight {off | low | med | high | crit}
      set <constraint_name>-severity {High | Medium | Low | Info}
      set <constraint_name>-trigger "<trigger-policy_name>"

   next
end
```

Variable	Description	Default
"<http-constraint_name>"	Enter the name of a new or existing HTTP protocol constraint. The maximum length is 63 characters. To display the list of existing constraints, enter: `edit ?`	No default.

Variable	Description	Default
`<constraint_name>-check {enable | disable}`	Specify whether FortiWeb includes the specified constraint when it applies this set of constraints.	
`<constraint_name>-action {alert | alert_deny | block-period | deny_no_log}`	Select one of the following actions that the FortiWeb appliance will perform when an HTTP request violates one of the rules: • `alert`—Accept the request and generate an alert email and/or log message. • `alert_deny`—Block the request (or reset the connection) and generate an alert email and/or log message. • `deny_no_log`—Deny a request. Do not generate a log message. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure `<constraint_name>-block-period <seconds_int>` (page 432). **Note:** If FortiWeb is deployed behind a NAT load balancer, when using this option, you **must** also define an X-header that indicates the original client's IP (see "waf x-forwarded-for" on page 551). Failure to do so may cause FortiWeb to block **all** connections when it detects a violation of this type. **Caution:** This setting is ignored when the value of `monitor-mode {enable | disable}` (page 146) is `enable`. **Note:** Logging and/or alert email will occur only if enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71. **Note:** If you select an auto-learning profile with this rule, you should select `alert`. If the `action` is `alert_deny`, for example, the FortiWeb appliance will block the request or reset the connection when it detects an attack, resulting in incomplete session information for	`alert`

Variable	Description	Default
	the auto-learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1. **Note:** This is not a single setting. Configure the action setting for each violation type. The number of action settings equals the number of violation types. For example, for maximum HTTP header length violations, you might type the accompanying setting: `set max-http-header-length-action alert` **Note:** Available actions vary depending on operating mode and protocol parameter.	
`<constraint_name>-severity {High | Medium | Low | Info}`	Select the severity level to use in logs and reports generated when a violation of the rule occurs. **Note:** This is not a single setting. Configure the severity setting for each violation type. The number of severity settings equals the number of violation types. For example, for maximum HTTP header length violations, you might type the accompanying setting: `set max-http-header-length-severity High`	`Medium`
`<constraint_name>-trigger "<trigger-policy_name>"`	Enter the name of the trigger to apply when this rule is violated (see `config log trigger-policy` (page 105)). The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?` **Note:** This is not a single setting. Configure the trigger setting for each violation type. The number of trigger settings equals the number of violation types. For example, for maximum HTTP header	No default.

Variable	Description	Default
	length violations, you might type accompanying setting: `set max-http-header-length-trigger trigger-policy1`	
`<constraint_name>-block-period <seconds_int>`	If `action` is `block-period`, type the number of seconds that the connection will be blocked. The valid range is 1–3,600.	`0`
`<parameter_name>-threat-weight {off | low | med | high | crit}`	Set the threat weight for an event when FortiWeb detects a violation of a parameter restriction rule. For details, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides.	No default.

Example

This example limits the total size of the HTTP header, including all lines, to 2,048 bytes. If the HTTP header length exceeds 2,048 bytes, the FortiWeb appliance takes an action to create a log message (`alert`), identifying the violation as `medium` severity, and sends an email to the administrators defined within the trigger policy `email-admin`.

```
config waf http-protocol-parameter-restriction
   edit "http-constraint1"
      set max-http-header-length 2048
      set max-http-header-length-action alert
      set max-http-header-length-severity Medium
      set max-http-header-length-trigger email-admin
   next
end
```

waf http-request-flood-prevention-rule

Use this command to limit the maximum number of HTTP requests per second coming from any client to a specific URL on one of your protected servers.

The FortiWeb appliance tracks the requests using a session cookie. If the count exceeds the request limit, FortiWeb performs the specified action.

To apply this rule, include it in an application-layer DoS-prevention policy. This feature is effective only when `http-session-management {enable | disable}` (page 531) is enabled in the inline protection profile that uses the parent DoS-prevention policy.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf http-request-flood-prevention-rule
   edit "<rule_name>"
      set access-limit-in-http-session <limit_int>
      set action {alert | alert_deny | block-period | deny_no_log}
      set bot-recognition {captcha-enforcement | real-browser-enforcement | disable}
      set max-attempt-times <attempts_int>
      set validation-timeout <seconds_int>
      set block-period <seconds_int>
      set severity {High | Medium | Low | Info}
      set trigger-policy "<trigger-policy_name>"
   next
end
```

Variable	Description	Default
`"<rule_name>"`	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.
`access-limit-in-http-session <limit_int>`	Enter the maximum number of HTTP connections allowed per second from the same client. The valid range is 0–4,096. To disable the limit, enter `0`.	0
`action {alert | alert_deny | block-period | deny_no_log}`	Select one of the following actions that the FortiWeb appliance will perform when the count exceeds the limit: • `alert`—Accept the request and generate an alert email and/or log message. • `alert_deny`—Block the request (or reset the connection) and generate an alert email and/or log message. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure `block-period <seconds_int>` (page 435).	`alert`

Variable	Description	Default
	Note: If FortiWeb is deployed behind a NAT load balancer, when using this option, you **must** also define an X-header that indicates the original client's IP (see `config waf x-forwarded-for` (page 551)). Failure to do so may cause FortiWeb to block **all** connections when it detects a violation of this type. • `deny_no_log`—Deny a request. Do not generate a log message. **Caution:** This setting will be ignored if `monitor-mode {enable | disable}` (page 146) is enabled. **Note:** Logging and/or alert email will occur only if enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71. **Note:** If you select an auto-learning profile with this rule, you should select `alert`. If the `action` is `alert_deny`, for example, the FortiWeb appliance will block the request or reset the connection when it detects an attack, resulting in incomplete session information for the auto-learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	
`bot-recognition {captcha-enforcement | real-browser-enforcement | disable}`	Enable to return a JavaScript to the client to test whether it is a web browser or automated tool when it exceeds the rate limit. If the client either fails the test or does not return results before the timeout specified by `validation-timeout <seconds_int>` (page 434), FortiWeb applies the specified action. If the client appears to be a web browser, FortiWeb allows the client to exceed the rate limit. Disable this option to apply the rate limit regardless of whether the client is a web browser (for example, Firefox) or an automated tool (for example, `wget`).	`disable`
`max-attempt-times <attempts_int>`	If `captcha-enforcement` is selected for `bot-recognition {captcha-enforcement | real-browser-enforcement | disable}` (page 434), enter the maximum number of attempts that a client may attempt to fulfill a CAPTCHA request. The valid range is 1–5. Available only when `captcha-enforcement` is selected for `bot-recognition`.	`3`
`validation-timeout <seconds_int>`	Specify the maximum amount of time (in seconds) that FortiWeb waits for results from the client for Real Browser Enforcement.	`20`

Variable	Description	Default
	The valid range is 5–30.	
`block-period <seconds_int>`	If `action` is `block-period`, type the number of seconds that the connection will be blocked. This setting applies only if `action` is `block-period`. The valid is from 1 to 10,000 seconds.	`60`
`severity {High | Medium | Low | Info}`	Select the severity level to use in logs and reports generated when a violation of the rule occurs.	Medium
`trigger-policy "<trigger-policy_name>"`	Enter the name of the trigger to apply when this rule is violated. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.

Example

This example illustrates a rule that imposes a two-minute blocking period on clients that exceed the set request limit.

```
config waf http-request-flood-prevention-rule
   edit "Web Portal HTTP Request Limit"
      set access-limit-in-http-session 10
      set action block-period
      set block-period 120
      set severity Medium
      set trigger-policy "Server_Policy_Trigger"
   next
end
```

waf input-rule

Use this command to configure input rules.

Input rules define whether or not parameters are required, and sets their maximum allowed length, for HTTP requests matching the host and URL defined in the input rule.

Each input rule contains one or more individual rules. This enables you to define, within one input rule, all parameter restrictions that apply to HTTP requests matching that URL and host name.

For example, one web page might have multiple inputs: a user name, password, and a preference for whether or not to remember the login. Within the input rule for that web page, you could define separate rules for each parameter in the HTTP request: one rule for the user name parameter, one rule for the password parameter, and one rule for the preference parameter.

To apply input rules, select them within a parameter validation rule. For details, see "waf parameter-validation-rule" on page 471.

Before you configure an input rule, if you want to apply it only to HTTP requests for a specific real or virtual host, you must first define the web host in a protected hosts group. For details, see "server-policy allow-hosts" on page 112.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf input-rule
   edit "<input-rule_name>"
      set action {alert | alert_deny | redirect | send_403_forbidden | block-period |
          deny_no_log}
      set block-period <seconds_int>
      set host "<protected-host_name>"
      set host-status {enable | disable}
      set request-file "<url_str>"
      set request-type {plain | regular}
      set severity {High | Medium | Low | Info}
      set trigger "<trigger-policy_name>"
      config rule-list
         edit <entry_index>
            set type-checked (enable | disable}
            set argument-type <custom-data-type | data-type | regular-expression}
            set argument-name-type {plain | regular}
            set argument-name "<input_name>"
            set argument-expression "<regex_pattern>"
            set custom-data-type "<custom-data-type_name>"
            set data-type "<predefined_name>"
            set is-essential {yes | no}
            set max-length <limit_int>
         next
      end
   next
end
```

Variable	Description	Default
`"<input-rule_name>"`	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.
`action {alert | alert_ deny | redirect | send_ 403_forbidden | block-`	Select one of the following actions that the FortiWeb appliance will perform when an HTTP request violates one	`alert`

Variable	Description	Default
period | deny_no_log}	of the input rules in the entry: • alert—Accept the request and generate an alert email and/or log message. • alert_deny—Block the request (or reset the connection) and generate an alert email and/or log message. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. • block-period—Block subsequent requests from the client for a number of seconds. Also configure block-period <seconds_int> (page 437). • redirect—Redirect the request to the URL that you specify in the protection profile and generate an alert email and/or log message. Also configure redirect-url "<redirect_fqdn>" (page 539) and rdt-reason {enable | disable} (page 539). • send_403_forbidden—Reply to the client with an HTTP 403 Access Forbidden error message and generate an alert email and/or log message. **Caution:** This setting will be ignored if monitor-mode {enable | disable} (page 146) is enabled. **Note:** Logging and/or alert email will occur only if enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71. **Note:** If you select an auto-learning profile with this rule, you should select alert. If the action is alert_deny, for example, the FortiWeb appliance will block the request or reset the connection when it detects an attack, resulting in incomplete session information for the auto-learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	
block-period <seconds_int>	Enter the number of seconds to block the source IP. The valid range is 0–3,600. This setting applies only if action {alert | alert_deny | redirect | send_403_forbidden | block-period | deny_no_log} (page 436) is block-period.	60
host "<protected-host_name>"	Enter the name of a protected host that the Host: field of an HTTP request must be in order to match the rule. The maximum length is 255 characters. This setting applies only if host-status {enable |	No default.

Variable	Description	Default
	`disable}` (page 438) is `enable`.	
`host-status {enable | disable}`	Enable to apply this input rule only to HTTP requests for specific web hosts. Also configure `host "<protected-host_name>"` (page 437). Disable to match the input rule based upon the other criteria, such as the URL, but regardless of the `Host:` field.	`disable`
`request-file "<url_str>"`	Depending on your selection in `request-type {plain | regular}` (page 438), enter either: • The literal URL, such as `/index.php`, that the HTTP request must contain in order to match the input rule. The URL must begin with a slash (/). • A regular expression, such as `^/*.php`, matching all and only the URLs to which the input rule should apply. The pattern is **not** required to begin with a slash (/). However, it must at least match URLs that begin with a slash, such as `/index.cfm`. Do not include the name of the web host, such as `www.example.com`, which is configured separately in `host "<protected-host_name>"` (page 437). The maximum length is 255 characters. **Note:** Regular expressions beginning with an exclamation point (`!`) are not supported. For information on language and regular expression matching, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides	No default.
`request-type {plain | regular}`	Select whether `request-file "<url_str>"` (page 438) will contain a literal URL (`plain`), or a regular expression designed to match multiple URLs (`regular`).	`plain`
`severity {High | Medium | Low | Info}`	Select the severity level to use in logs and reports generated when a violation of the rule occurs.	`Low`
`trigger "<trigger-policy_name>"`	Enter the name of the trigger to apply when this rule is violated. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.

Variable	Description	Default
`is-essential {yes | no}`	Select `yes` if the parameter is required for HTTP requests to this combination of `Host:` field and URL. Otherwise, select `no`.	`no`
`max-length <limit_int>`	Enter the maximum allowed length of the parameter value. The valid range is 0–1,024. To disable the limit, enter `0`.	`0`
`type-checked (enable | disable}`	Enable to use predefined or configured data types when validating parameters. Also configure `argument-type <custom-data-type | data-type | regular-expression}` (page 439). Disable to ignore `data-type` and `custom-data-type` settings.	`enable`
`argument-type <custom-data-type | data-type | regular-expression}`	Specify the type of argument.	No default.
`argument-name-type {plain | regular}`	Specify one of the following options: • `plain`—`argument-name` is the name attribute of the parameter's input tag exactly as it appears in the form on the web page. • `regular`—`argument-name` is a regular expression designed to match the name attribute of the parameter's input tag.	
`argument-name "<input_name>"`	If `argument-name-type {plain | regular}` (page 439) is `plain`, specify the name of the input as it appears in the HTTP content, such as `username`. The maximum length is 63 characters. If `argument-name-type` is `regular`, specify a regular expression designed to match the name attribute of the parameter's input tag.	No default.
`argument-expression "<regex_pattern>"`	Enter a regular expression that matches all valid values, and no invalid values, for this input. The maximum length is 2,071 characters. **Note:** Regular expressions beginning with an exclamation point (`!`) are not supported.	
`custom-data-type "<custom-data-type_name>"`	Enter the name of a custom data type, if any. The maximum length is 63 characters. To display the list of custom data types, enter: `set custom-data-type ?`	No default.

Variable	Description	Default
	This setting applies only if `type-checked {enable | disable}` (page 439) is `enable`.	
`data-type "<predefined_name>"`	Select one of the predefined data types, if the input matches one of them (available options vary by FortiGuard updates). To display available options, enter: `set data type ?` For match descriptions of each option, see "server-policy pattern data-type-group" on page 1. Alternatively, configure `argument-type <custom-data-type | data-type | regular-expression}` (page 439). This option is ignored if you configure `argument-type`, which also defines parameters to which the input rule applies, but supersedes this option.	No default.

Example

This example blocks and logs requests for the file named login.php that do not include a user name and password, both of which are required, or whose user name and password exceed the 64-character limit.

```
config waf input-rule
   edit "input_rule1"
      set action alert_deny
      set request-file "/login.php?*"
      request-type regular
      config rule-list
         edit 1
            set argument-name "username"
            set argument-type data-type
            set data-type Email
            set is-essential yes
            set max-length 64
         next
         edit 2
            set argument-name "password"
            set data-type String
            set is-essential yes
            set max-length 64
         next
      end
   next
end
```

waf ip-intelligence

Use this command to configure reputation-based source IP blacklisting.

Clients with suspicious behaviors or poor reputations include spammers, phishers, botnets, and anonymizing proxy users. If you have purchased a subscription for the FortiGuard IP Reputation service, your FortiWeb can periodically download an updated blacklist to keep your appliance current with changes in dynamic IPs, spreading virus infections, and spammers changing service providers.

IP intelligence settings apply globally, to all policies that use this feature.

Before or after using this command, use "waf ip-intelligence-exception" on page 444 to configure any exemptions that you want to apply. To apply IP reputation-based blocking, configuring these category settings first, then enable `ip-intelligence {enable | disable}` (page 536) in the server policy's protection profile.

Alternatively, you can block sets of many clients based upon their geographical origin (see "waf geo-block-list" on page 406) or manually by specific IPs (see "server-policy custom-application application-policy" on page 1).

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf ip-intelligence
  edit <entry_index>
    set action {alert | alert_deny | redirect | send_403_forbidden | block-period |
        deny_no_log}
    set block-period <seconds_int>
    set category "<category_name>"
    set severity {Low | Medium | High | Info}
    set status {enable | disable}
    set trigger "<trigger-policy_name>"
  next
end
```

Variable	Description	Default
`<entry_index>`	Enter the index number of the individual entry in the table entry in the table.	No default.
`action {alert | alert_deny | redirect | send_403_forbidden | block-period | deny_no_log}`	Select one of the following actions that the FortiWeb appliance performs when a client's source IP matches the blacklist category: • `alert`—Accept the request and generate an alert email and/or log message. • `alert_deny`—Block the request (or reset the connection) and generate an alert email and/or log message. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see	`alert`

Variable	Description	Default
	"system replacemsg" on page 296. • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure `block-period <seconds_int>` (page 442). • `redirect`—Redirect the request to the URL that you specify in the protection profile and generate an alert email and/or log message. Also configure `redirect-url "<redirect_fqdn>"` (page 539) and `rdt-reason {enable | disable}` (page 539). • `send_403_forbidden`—Reply to the client with an HTTP `403 Access Forbidden` error message and generate an alert email and/or log message. • `deny_no_log`—Deny a request. Do not generate a log message. **Caution:** FortiWeb ignores this setting when `monitor-mode {enable | disable}` (page 146) is enabled. **Note:** Logging and/or alert email will occur only if enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71. **Note:** If you select an auto-learning profile with this rule, you should select `alert`. If the `action` is `alert_deny`, for example, the FortiWeb appliance will block the request or reset the connection when it detects an attack, resulting in incomplete session information for the auto-learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	
`block-period <seconds_int>`	Enter the number of seconds to block the source IP. The valid range is 0–3,600. This setting applies only if `action {alert | alert_deny | redirect | send_403_forbidden | block-period | deny_no_log}` (page 441) is `block-period`.	`60`
`category "<category_name>"`	Enter the name of an existing IP intelligence category, such as `"Anonymous Proxy"` or `Botnet`. If the category name contains a space, you must surround the name in double quotes. The maximum length is 63 characters. Category names vary by the version number of your FortiGuard IRIS package.	
`status {enable |`	Enable to block clients whose source IP belongs to this category	`enable`

Variable	Description	Default
`disable}`	according to the FortiGuard IRIS service.	
`severity {Low | Medium | High | Info}`	When rule violations are recorded in the attack log, each log message contains a **Severity Level** (`severity_level`) field. Select which severity level the FortiWeb appliance uses when a blacklisted IP address attempts to connect to your web servers: • `Low` • `Medium` • `High` • `Info`	`Low`
`trigger "<trigger-policy_name>"`	Select which trigger, if any, that the FortiWeb appliance uses when it logs and/or sends an alert email about a blacklisted IP address's attempt to connect to your web servers. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.

Example

The following command blacklists clients whose source IPs are currently known by Fortinet to be members of a botnet. In the FortiGuard IRIS package for this example, "Botnet" is the first item in the list of categories.

When a botnet member makes a request, FortiWeb blocks the connection and continues to block it without re-evaluating it for the next 6 minutes (360 seconds). FortiWeb logs the event with a high severity level and sends notifications to the Syslog and email servers specified in `notification-servers1`.

```
config waf ip-intelligence
   edit 1
      set status enable
      set action period_block
      set block-period 360
      set severity High
      set trigger-policy "notification-servers1"
   next
end
```

waf ip-intelligence-exception

Use this command to exempt IP addresses from reputation-based blocking. The settings apply globally, to all policies that use this feature.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf ip-intelligence-exception
   edit <entry_index>
      set status {enable | disable}
      set ip "<client_ipv4>"
   next
end
```

Variable	Description	Default
`<entry_index>`	Enter the index number of the individual entry in the table entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`status {enable | disable}`	Enable to exempt clients from IP reputation-based blocking.	`disable`
`ip "<client_ipv4>"`	Enter the client's source IP address.	No default.

Example

See "waf ip-intelligence" on page 441.

Related topics

- "waf ip-intelligence" on page 441

waf ip-list

Use this command to define which source IP addresses are trusted clients, undetermined, or distrusted.

- **Trusted IPs**—Almost always allowed to access to your protected web servers. Trusted IPs are exempt from many (but not all) of the restrictions that would otherwise be applied by a server policy. To determine skipped scans, see "debug flow trace" on page 598.

- **Neither**—If a source IP address **is neither** explicitly blacklisted or trusted by an IP list policy, the client can access your web servers, **unless** it is blocked by any of your other configured, subsequent web protection scan techniques. For details, see "debug flow trace" on page 598.
- **Blacklisted IPs**—Blocked and prevented from accessing your protected web servers. Requests from blacklisted IP addresses receive a warning message in response. The warning message page includes **ID: 70007**, which is the ID of all attack log messages about requests from blacklisted IPs.

Because FortiWeb evaluates trusted and blacklisted IP policies before many other techniques, defining these IP addresses can improve performance.

Alternatively, you can block sets of many clients based upon their reputation (see "waf ip-intelligence" on page 441) or geographical origin (see "waf geo-block-list" on page 406).

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf ip-list
  edit "<ip-list_name>"
    config members
      edit <entry_index>
        set ip "<client_ip>"
        set type {trust-ip | black-ip}
        set severity {Low | Medium | High | Info}
        set trigger-policy "<trigger-policy_name>"
      next
    end
  next
end
```

Variable	Description	Default
`"<ip-list_name>"`	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`ip "<client_ip>"`	Enter one of the following values: • A single IP address that a client source IP must match, such as a trusted private network IP address (e.g. an administrator's computer, `172.16.1.20`). • A range or addresses (for example, `172.22.14.1-172.22.14.255` or `10:200::10:1-10:200:10:100`).	No default.

Variable	Description	Default
`type {trust-ip | black-ip}`	Select either: • `trust-ip`—The source IP address is trusted and allowed to access your web servers, **unless** it fails a previous scan (see `diagnose debug flow trace` (page 598)). • `black-ip`—The source IP address that is **dis**trusted, and is permanently blocked (blacklisted) from accessing your web servers, even if it would normally pass all other scans. **Note:** If multiple clients share the same source IP address, such as when a group of clients is behind a firewall or router performing network address translation (NAT), blacklisting the source IP address could block innocent clients that share the same source IP address with an offending client.	`trust-ip`
`severity {Low | Medium | High | Info}`	When rule violations are recorded in the attack log, each log message contains a **Severity Level** (`severity_level`) field. Select which severity level the FortiWeb appliance will use when a blacklisted IP address attempts to connect to your web servers: • `Low` • `Medium` • `High`	No default.
`trigger-policy "<trigger-policy_name>"`	Select which trigger, if any, that the FortiWeb appliance will use when it logs and/or sends an alert email about a blacklisted IP address's attempt to connect to your web servers. The maximum length is 63 characters. For details, see `config log trigger-policy` (page 105). To display the list of existing trigger policies, enter: `set trigger ?`	No default.

Example

The following shows the configuration for a trusted host of `192.0.2.0` followed by a blacklisted client of `192.0.2.1`.

```
config waf ip-list
   edit "IP-List-Policy1"
      config members
         edit 1
            set ip "192.0.2.0"
            next
         edit 2
            set type black-ip
            set ip "192.0.2.1"
            set severity Medium
            set trigger-policy "TriggerActionPolicy1"
         next
```

```
      end
    next
  end
```

waf layer4-access-limit-rule

Use this command to limit the number of HTTP requests per second from any IP address to your web server. The FortiWeb appliance tracks the number of requests. If the count of HTTP `GET` or `POST` requests exceeds the request limit, FortiWeb performs the action you specified.

To apply this rule, include it in an application-layer DoS-prevention policy and include that policy in an inline protection profile. For details, see "waf application-layer-dos-prevention" on page 344.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf layer4-access-limit-rule
  edit "<rule_name>"
    set access-limit-standalone-ip <limit_int>
    set access-limit-share-ip <limit_int>
    set action {alert | alert_deny | block-period | deny_no_log}
    set bot-recognition {captcha-enforcement | real-browser-enforcement}
    set max-attempt-times <attempts_int>
    set block-period <seconds_int>
    set severity {High | Medium | Low | Info}
    set trigger-policy "<trigger-policy_name>"
    set validation-timeout <seconds_int>

  next
end
```

Variable	Description	Default
"<rule_name>"	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.

Variable	Description	Default
`access-limit-standalone-ip <limit_int>`	Enter the maximum number of HTTP requests allowed per second from any source IP address representing a single client. The valid range is 0–65,536. To disable the limit, enter `0`.	0
`access-limit-share-ip <limit_int>`	Enter the maximum number of HTTP requests allowed per second from any source IP address shared by multiple clients behind a network address translation (NAT) device, such as a firewall or router. The valid range is 0–65,536. To disable the limit, enter `0`.	0
`action {alert | alert_deny | block-period | deny_no_log}`	Select one of the following actions that the FortiWeb appliance will perform when the count exceeds either threshold limit: • `alert`—Accept the request and generate an alert email and/or log message. • `alert_deny`—Block the request (or reset the connection) and generate an alert email and/or log message. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure `block-period <seconds_int>` (page 449). **Note:** If FortiWeb is deployed behind a NAT load balancer, when using this option, you **must** also define an X-header that indicates the original client's IP. Failure to do so may cause FortiWeb to block **all** connections when it detects a violation of this type. For details, see "waf x-forwarded-for" on page 551. • `deny_no_log`—Deny a request. Do not generate a log message. **Caution:** This setting will be ignored if `monitor-mode {enable | disable}` (page 146) is enabled. **Note:** Logging and/or alert email will occur only if enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71. **Note:** If you select an auto-learning profile with this rule, you should select `alert`. If the `action` is `alert_deny`, for example, the FortiWeb appliance will block the request or reset the connection when it detects an attack, resulting in incomplete session information for the auto-learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	`alert`

Variable	Description	Default
`bot-recognition {captcha-enforcement | real-browser-enforcement}`	Select between: • `captcha-enforcement`—Requires the client to successfully fulfill a CAPTCHA request. If the client cannot successfully fulfill the request within the `max-attempt-times <attempts_int>` (page 449), or doesn't fulfill the request within the `validation-timeout <seconds_int>` (page 449), FortiWeb applies the `action` and sends the CAPTCHA block page. • `real-browser-enforcement`—Enable to return a JavaScript to the client to test whether it is a web browser or automated tool when it violates the access rule. If the client either fails the test or does not return results before the timeout specified by `validation-timeout`, FortiWeb applies the specified action. If the client appears to be a web browser, FortiWeb allows the client to violate the rule. Disable this option to simply apply the access rule.	`disable`
`max-attempt-times <attempts_int>`	If `captcha-enforcement` is selected for `bot-recognition`, enter the maximum number of attempts that a client may attempt to fulfill a CAPTCHA request. The valid range is 1–5. Available only when `captcha-enforcement` is selected for `bot-recognition`.	`3`
`block-period <seconds_int>`	Enter the number of seconds to block access to the client. This applies only when the `action {alert | alert_deny | block-period | deny_no_log}` (page 448) setting is `block-period`. The valid range is 0–10,000. To disable the limit, enter `0`.	0
`severity {High | Medium | Low | Info}`	Select the severity level to use in logs and reports generated when a violation of the rule occurs.	`Medium`
`trigger-policy "<trigger-policy_name>"`	Enter the name of the trigger to apply when this rule is violated. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
`validation-timeout <seconds_int>`	Enter the maximum amount of time (in seconds) that FortiWeb waits for results from the client for bot-recognition. The valid range is 5–30.	`20`

Example

This examples includes two rules. One blocks connections for two minutes while the other creates an alert and denies the connection.

```
config waf layer4-access-limit-rule
   edit "Web Portal HTTP Request Limit"
      set access-limit-share-ip 10
      set access-limit-standalone-ip 10
      set action block-period
      set block-period 120
      set severity Medium
      set trigger-policy "Web_Protection_Trigger"
   next
   edit "Online Store HTTP Request Limit"
      set access-limit-share-ip 5
      set access-limit-standalone-ip 5
      set action alert_deny
      set severity High
      set trigger-policy "Web_Protection_Trigger"
   next
end
```

- "waf layer4-connection-flood-check-rule" on page 450

waf layer4-connection-flood-check-rule

Use this command to limit the number of fully-formed TCP connections per source IP address. This effectively prevents TCP flood-style denial-of-service (DoS) attacks.

TCP flood attacks exploit the fact that servers must consume memory to maintain the state of the open connection until either the timeout, or the client or server closes the connection. This consumes some memory even if the client is not currently sending any HTTP requests.

Normally, a legitimate client forms a single TCP connection, through which they may make several HTTP requests. As a result, each client consumes a negligible amount of memory to track the state of the TCP connection. However, an attacker opens many connections with perhaps zero or one request each, until the server is exhausted and has no memory left to track the TCP states of new connections with legitimate clients.

This command is similar to `config waf http-connection-flood-check-rule` (page 419). However, this feature counts TCP connections per IP, while the other command counts TCP connections per session cookie.

It is also similar to `syncookie` in "server-policy policy" on page 136. However, this feature counts fully-formed TCP connections, while the anti-SYN flood feature counts partially-formed TCP connections.

To apply this rule, include it in an application-layer DoS-prevention policy and include that policy in an inline protection profile. For details, see "waf application-layer-dos-prevention" on page 344.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf layer4-connection-flood-check-rule
  edit "<rule_name>"
    set layer4-connection-threshold <limit_int>
    set action {alert | alert_deny | block-period | deny_no_log}
    set block-period <seconds_int>
    set severity {High | Medium | Low | Info}
    set trigger-policy "<trigger-policy_name>"
  next
end
```

Variable	Description	Default
`"<rule_name>"`	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.
`layer4-connection-threshold <limit_int>`	Enter the maximum number of TCP connections allowed from the same IP address. The valid range is 0–65,536.	0
`action {alert | alert_deny | block-period | deny_no_log}`	Select one of the following actions that the FortiWeb appliance will perform when the count exceeds the rate limit: • `alert`—Accept the connection and generate an alert email and/or log message. • `alert_deny`—Block the connection and generate an alert email and/or log message. • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure `block-period <seconds_int>` (page 452). • `deny_no_log`—Deny a request. Do not generate a log message. **Caution:** This setting will be ignored if `monitor-mode {enable | disable}` (page 146) is enabled. **Note:** Logging and/or alert email will occur only if enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71. **Note:** If an auto-learning profile will be selected in the policy with Offline Protection profiles that use this rule, you should select `alert`. If the `action` is `alert_deny`, the FortiWeb appliance will reset the connection when it detects an attack, resulting in incomplete session information for the auto-	`alert`

Variable	Description	Default
	learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	
`block-period <seconds_int>`	Enter the length of time (in seconds) for which the FortiWeb appliance will block additional requests after a source IP address exceeds the rate threshold. The block period is shared by all clients whose traffic originates from the source IP address. The valid range is 1–3,600.	`1`
`severity {High | Medium | Low | Info}`	Select the severity level to use in logs and reports generated when a violation of the rule occurs.	Medium
`trigger-policy "<trigger-policy_name>"`	Enter the name of the trigger to apply when this rule is violated. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.

Example

This example illustrates a basic TCP flood check rule.

```
config waf layer4-connection-flood-check-rule
   edit "Web Portal Network Connect Limit"
      set action alert_deny
      set layer4-connection-threshold 10
      set severity Medium
      set trigger-policy "Server_Policy_Trigger"
   next
end
```

waf machine-learning

Use this command to enable the machine learning feature and configure its settings.

Syntax

```
config waf machine-learning url-replacer-rule
   edit url-replacer-rule_name
      set type {pre-defined | custom-defined}
      set app-type {jsp | owa-2003}
      set url-replacer-policy_name
      set url "<url_str>"
      set new-url "<new-url_str>"
      set param "<param_str>"
      set new-param "<new-param_str>"
   next
end
config waf machine-learning url-replacer-policy
   edit url-replacer-policy_name
      config rule list
         edit rule-id "<rule_id>"
            set type URL_Replacer
            set plugin-name "<plugin-name_str>"
         next
      end
   next
end
```

Variable	Description	Default
`url-replacer-rule_name`	Specify a unique name that can be referenced by other parts of the configuration. The name can be up to 63 characters long with no space or special character.	No default.
`type {pre-defined | custom-defined}`	Select either of the following: • Predefined—Use one of the predefined URL replacers which can be selected from the Application Type below. • Custom-Defined—Define your own URL replacer by configuring the URL Path, New URL, Param Change, and New Param fields below.	No default.
`app-type {jsp | owa-2003}`	If you have selected Predefined in the Type field above, then you must click the down arrow and select either of the following from the list menu:	No default.

Variable	Description	Default
	• JSP—Use the URL replacer designed for Java server pages (JSP) web applications, where parameters are often separated by semi-colon (;). • OWA 2003— Use the URL replacer designed for default URLs in Microsoft Outlook Web App (OWA), where user name and directory parameters are often embedded within the URL, as illustrated below: (^/public/)(.*) (^/exchange/)([^/]+)/*(([^/]+)/(.*))* These two application types are predefined URL interpreter plug-ins used by popular web applications.	
`url "<url_str>"`	Enter a regular expression, such as (^/[^/]+)/(.*), matching all and only the URLs to which the URL replacer should apply. The URL path can be up to 255 characters long. The pattern does not require a backslash (/). However, it must at least match URLs that begin with a backslash as they appear in the HTTP header, such as /index.html. Do not include the domain name, such as www.example.com.	No default.
`new-url "<new-url_str>"`	Enter either a literal URL, such as /index.html, or a regular expression with a back-reference (such as $1) defining how the URL will be interpreted. The new URL cab be up to 255 characters long.	No default.
`param "<param_str>"`	Enter either the parameter's literal value, such as user1, or a back-reference (such as $0) defining how	No default.

Variable	Description	Default
	the value will be interpreted.	
`new-param "<new-param_str>"`	Type either the parameter's literal name, such as username, or a backreference (such as $2) defining how the parameter's name will be interpreted in the auto-learning report. You can use up to 255 characters.	No default.
`url-replacer-policy_name`	Specify a unique name that can be referenced by other parts of the configuration. The name can be up to 63 characters long with no space or special character.	No default.
`rule-id "<rule_id>"`	Select the sequence number of the URL Replacer Rules	No default.
`type URL_Replacer`	Select the type URL_Replacer.	No default.
`plugin-name "<plugin-name_str>"`	Enter the plugin name.	No default.

waf machine-learning-policy

Use this command to create machine learning policies and configure related policy settings.

Syntax

```
config waf machine-learning-policy
   edit waf machine-learning-policy
      set hmm-engine {enable | disable}
      setsample-collecting-mode {normal | fast}
      set sample-limit-by-ip <sample-limit-by-ip_int>
      set svm-model {xss | sql-injection | code-injection | command-injection | lfi-rfi
          | common-injection | remote-exploits}
      set strictness-level-quantile-potential
      set strictness-level-quantile-defnite
      set strictness-level-anomaly
      set automatic-refresh-model {enable | disable}
      set box-notch-count <box-notch-count_int>
      set boxplot-checking-interval <boxplot-checking-interval_int>
      set allow-method {enable | disable}
```

```
        set allow-method-exceptions {none others get post head options trace connect
            delete put patch webdav rpc}
        set action-anomaly {alert | alert_deny | block-period}
        set action-page-method {alert | alert_deny | block-period}
        set block-period-potential "<block-period-potential_int>"
        set severity-page-method {High | Info | Low | Medium}
        set block-period-definitely "<block-period-definitely_int>"
        set severity-definitely {High | Info | Low | Medium}
        set trigger-definitely "<policy_name>"
        set block-period-page-method "<block-period-page-method_int>"
        set severity-page-method {High | Info | Low | Medium}
        set trigger-page-method "<policy_name>"
        set app-change-sensitivity {High | Low | Medium}
        set status {enable | disable}
        set ip-list-type {Trust | Black}
        set url-replacer-policy
        config waf machine-learning-policy
           edit "<allow-domain-name_id>"
              set domain-name "<domain-name_str>"
              set domain-index "<domain-index_id>"
              set character-set {AUTO | ISO-8859-1 | ISO-8859-2 | ISO-8859-3 | ISO-8859-4 |
                  ISO-8859-5 | ISO-8859-6 | ISO-8859-7 | ISO-8859-8 | ISO-8859-9 | ISO-8859-
                  10 | ISO-8859-15 | GB2312 | BIG5 | ISO-2022-JP | ISO-2022-JP-2 | Shift-JIS
                  | ISO-2022-KR | UTF-8}

    next
end
      config source-ip-list
         edit "<source-ip-list_id>"
            set "<ip>"
    next
end
```

Variable	Description	Default
`machine-learning-policy_id`	Enter the ID of the machine learning policy. It's the number displayed in the "**#**" column of the machine learning policy table on the **Machine Learning Policy** page. The valid range is 0–65535.	No default
`hmm-engine {enable | disable}`	Enable to monitor access to the application and collect data to build a mathematical model behind every parameter.	`enable`
`sample-collecting-mode {normal | fast}`	**Normal** Up to 5000 samples will be collected to build a machine learning model for the parameter. The default sample collection mode is Normal. **Fast** Up to 2500 samples will be collected to build a machine learning model for the parameter.	`Normal`
`sample-limit-by-ip <sample-limit-by-ip_int>`	The limitation number of samples collected from each IP. The valid range is 0–5000.	`30`

Variable	Description	Default
`svm-model {xss | sql-injection | code-injection | command-injection | lfi-rfi | common-injection | remote-exploits}`	Enable or disable threat models for different types of threats such as cross-site scripting, SQL injection and code injection. Currently, seven trained Support Vector Machine Model are provided for seven attack types.	`enable`
`strictness-level-quantile-potential`	Enter the threshold value or choose the threshold numbers. The valid range is from 0 to 1. The higher the threshold, the more anomalies will be triggered.	`0.3`
`strictness-level-quantile-defnite`	Enter the threshold value or choose the threshold numbers. The valid range is from 0 to 0.9. The higher the threshold, the more anomalies will be triggered.	`0.1`
`strictness-level-anomaly`	Enter the value for the strictness level. The valid range is from 0.1 to 0.9. The higher the value is , the more definite anomalies will be triggered.	`0.1`
`automatic-refresh-model {enable | disable}`	Enable to let the system to relearn the argument related to the HMM model.	`enable`
`box-notch-count <box-notch-count_int>`	This option appears when you enable **Dynamically update when parameters change**. The default value is 2, which means if 2 newly generated boxplots don't overlap with any one of the sample boxplots, FortiWeb automatically updates the machine learning model. You can set a value from 1 to 3.	`2`
`boxplot-checking-interval <boxplot-checking-interval_int>`	The interval to collect a boxplot after the parameter model changes to running status. The valid range is 1–15 minutes.	`15`
`allow-method {enable | disable}`	Enable to allow the system to learn and verify the HTTP method.	`enable`
`allow-method-exceptions {none others get post head options trace connect delete put patch webdav rpc}`	Select the HTTP request method that is allowed to access the URL.	`head, options`
`action-anomaly {alert | alert_deny | block-period}`	Choose the action FortiWeb takes when definite attack is verified. alert—Accepts the connection and generates an alert email and/or log message. alert_deny—Blocks the request (or resets the connection) and generates an alert and/or log message. block-period—Blocks the request for a certain period of time.	`alert_deny`
`action-page-method {alert | alert_deny |`	Choose the action FortiWeb takes when HTTP method violation is verified.	`alert_deny`

Variable	Description	Default
`block-period}`	alert—Accepts the connection and generates an alert email and/or log message. alert_deny—Blocks the request (or resets the connection) and generates an alert and/or log message. block-period—Blocks the request for a certain period of time.	
`block-period-potential "<block-period-potential_int>"`	Enter the number of seconds that you want to block the requests. The valid range is 1–3,600 seconds. This option only takes effect when you choose **Period Block** in **Action**.	`60`
`severity-definitely {High | Info | Low | Medium}`	Select the severity level for this anomaly type. The severity level will be displayed in the alert email and/or log message.	`High`
`trigger-definitely "<policy_name>"`	Select a trigger policy that you have set in Log&Report > Log Policy > Trigger Policy. If definite anomaly is detected, it will trigger the system to send email and/or log messages according to the trigger policy.	No default.
`block-period-definitely "<block-period-definitely_int>"`	Enter the number of seconds that you want to block the requests. The valid range is 1–3,600 seconds. This option only takes effect when you choose **Period Block** in **Action**.	`60`
`block-period-page-method "<block-period-page-method_int>"`	Enter the number of seconds that you want to block the requests. The valid range is 1–3,600 seconds. The default value is 60 seconds. This option only takes effect when you choose **Period Block** in **Action**.	`60`
`severity-page-method {High | Info | Low | Medium}`	Select the severity level for this anomaly type. The severity level will be displayed in the alert email and/or log message.	`High`
`trigger-page-method "<policy_name>"`	Select a trigger policy that you have set in Log&Report > Log Policy > Trigger Policy. If HTTP Method Violation is detected, it will trigger the system to send email and/or log messages according to the trigger policy.	No default
`app-change-sensitivity {High | Low | Medium}`	This option appears when you enable **Dynamically update when parameters change**. Low—The system triggers model update only when the entire data distribution area (from the maximum value to the minimum value, that is, the entire area containing all the data) of the new boxplot doesn't have any overlapping part with that of the sample boxplots. Medium—The system triggers model update if the notch area (the median rectangular area in the boxplot where most of the data is located) of the new boxplot doesn't have any overlapping part with	No default.

Variable	Description	Default
	the entire data distribution areas of the sample boxplots. High—The system triggers model update as long as the notch area of the new boxplot doesn't have any overlapping part with that of the sample boxplots.	
`status {enable | disable}`	Enable to change the status to Running, while disable to change the status to Stopped.	`enable`
`url-replacer-policy`	Select the name of the URL Replacer Policy that you have created in Machine Learning Templates. If web applications have dynamic URLs or unusual parameter styles, you must adapt URL Replacer Policy to recognize them.	No default.
`trigger-potential "<policy_name>"`	Select a trigger policy that you have set in Log&Report > Log Policy > Trigger Policy. If potential anomaly is detected, it will trigger the system to send email and/or log messages according to the trigger policy.	
`"<allow-domain-name_id>"`	Enter the ID of the policy. The valid range is 1–65,535.	No default.
`ip-list-type {Trust | Black}`	Allow or deny sample collection from the Source IP list.	`Trust`
`domain-name "<domain-name_str>"`	Add full domain name or use wildcard '*' to cover multiple domains under one profile.	No default.
`domain-index "<domain-index_id>"`	The number automatically assigned by the system when the domain name is created.	No default.
`character-set {AUTO | ISO-8859-1 | ISO-8859-2 | ISO-8859-3 | ISO-8859-4 | ISO-8859-5 | ISO-8859-6 | ISO-8859-7 | ISO-8859-8 | ISO-8859-9 | ISO-8859-10 | ISO-8859-15 | GB2312 | BIG5 | ISO-2022-JP | ISO-2022-JP-2 | Shift-JIS | ISO-2022-KR | UTF-8}`	The corresponding character code when manually setting the domain.	No default.
`"<source-ip-list_id>"`	Enter the ID of the source IP. The valid range is 1–9,223,372,036,854,775,807	No default.
`"<ip>"`	Enter the IP range for the source IP list.	No default.

waf mitb-policy

Use this command to configure MiTB policies.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf mitb-policy
   edit "<mitb-rule_name>"
      config rule list
         edit "<rule-list_id>"
            set "<mitb-rule_name>"
         next
      end
   next
end
```

Variable	Description	Default
`"<rule-list_id>"`	Select the sequence number of the MiTB rules.	No default.
`"<mitb-rule_name>"`	Enter the name of a MiTB policy.	No default.

Related topics

- waf mitb-rule

waf mitb-rule

Use this command to configure MiTB rules.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf mitb-rule
   edit mitb-rule_name
      set action {alert| alert_deny}
      set severity {High | Medium | Low | Info}
      set trigger "<trigger-policy_name>"
```

```
set host-status {enable | disable}
set host "<host_str>"
set request-url "<request-url_str>"
set request-type {plain | regular}
set post-url "<post-url_str>"
edit protected-parameter-list_name
     set type {regular-input | password-input}
     set obfuscate {enable | disable}
     set encrypt {enable | disable}
     set anti-keyLogger {enable | disable}
   next
end

config allowed-external-domains-list
   edit allowed-external-domains-list_id
      set domain "<domain_str>"
   next
end
```

Variable	Description	Default
`mitb-rule_name`	Enter a name that can be referenced by other parts of the configuration.	No default.
`action {alert| alert_ deny}`	Select the action the FortiWeb appliance takes when it detects a violation of the rule: **Alert**—Accept the connection and generate an alert email and/or log message. **Alert & Deny**—Block the request (or reset the connection) and generate an alert and/or log message.	`Alert`
`severity {High | Medium | Low | Info}`	Select which severity level the FortiWeb appliance will use when it logs a violation of the rule.	`Low`
`trigger "<trigger-policy_name>"`	Select which trigger, if any, that the FortiWeb appliance will use when it logs and/or sends an alert email about a violation of the rule.	No default.
`host-status {enable | disable}`	Enable to compare the MiTB rule to the `Host:` field in the HTTP header.	No default.
`host "<host_str>"`	Select the IP address or FQDN of a protected host.	No default.
`request-url "<request-url_str>"`	The URL hosting the webpage which contains the parameters (field names or passwords) you want to protect.	No default.
`request-type {plain | regular}`	Select either of the URL types.	`plain`
`post-url "<post-url_ str>"`	Enter the URL triggered after you submit your access request.	No default.

Variable	Description	Default
`protected-parameter-list_name`	Enter the protected parameter list name.	No default.
`type {regular-input | password-input}`	Select the input type to carry out the protection.	`regular-input`
`obfuscate {enable | disable}`	Enable to obfuscate the configured parameter name.	No default.
`encrypt {enable | disable}`	Enable to encrypt the parameter value.	No default.
`anti-keyLogger {enable | disable}`	Enable anti-keyLogger to prevent hackers from intercepting your password input.	No default.
`allowed-external-domains-list_id`	Enter the allowed external domain list ID.	No default.
`domain "<domain_str>"`	Set the domain, for example, www.alloweddomain.com.	No default.

waf openapi-file

Use this command to create openapi file name.

Syntax

```
config waf openapi-file
   edit "<openapi-file_name>"
end
```

Variable	Description	Default
`"<openapi-file_name>"`	Enter the name of an openapi file.	No default.

Related topics

- "waf openapi-validation-policy" on page 462

waf openapi-validation-policy

Use this command to create new openapi validation policy and configure related settings.

Syntax

```
config waf openapi-validation-policy
   edit openapi-validation-policy_name
      set action {alert | alert_deny | block-period | redirect | send_403_forbidden |
          deny_no_log}
      set block-period "<seconds_int>"
      set severity {Low | Medium | High | Info}
      set trigger "<trigger-policy>"
      config schema-file
         edit schema-file_id
            set openapi-file <datasource>
end
```

Variable	Description	Default
`openapi-validation-policy_name`	Enter the name for the OpenAPI validation policy.	No default
`action {alert | alert_deny | block-period | redirect | send_403_forbidden | deny_no_log}`	Select which action FortiWeb will take when it detects a violation of the policy.	`alert`
`block-period "<seconds_int>"`	Type the number of seconds that you want to block subsequent requests from the client after the FortiWeb appliance detects that the client has violated the rule. The valid range is 1–3600 seconds.	60
`severity {Low | Medium | High | Info}`	Select which severity level the FortiWeb appliance will use when it logs a violation of the rule.	Low
`trigger "<trigger-policy>"`	Select which trigger, if any, that the FortiWeb appliance will use when it logs and/or sends an alert email about a violation of the rule.	No default
`schema-file_id`	The scheme file by the sequence number.	No default.
`openapi-file <datasource>`	Select the created OpenAPI file.	No default.

- waf openapi-file

waf padding-oracle

Use this command to create a policy that protects vulnerable block cipher implementations for web applications that selectively encrypt inputs without using HTTPS.

To apply this policy, include it in an inline web or Offline Protection profile. For details, see "waf web-protection-profile inline-protection" on page 528 and "waf web-protection-profile offline-protection" on page 541.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf padding-oracle
   edit "<padding-oracle_rule_name>"
      set action {alert | alert_deny | block-period | deny_no_log}
      set block-period <block-period_int>
      set severity {High | Medium | Low | Info}
      set trigger "<trigger-policy_name>"
      config protected-url-list
         edit <entry_index>
            set host-status {enable | disable}
            set host "<host_str>"
            set url-type {plain | regular}
            set protected-url "<protected-url_str>"
            set target "<cookie parameter url>"
      end
   next
end
```

Variable	Description	Default
`"<padding-oracle_rule_name>"`	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing policies, enter: `edit ?`	No default.
`action {alert | alert_deny | block-period | deny_no_log}`	Specify the action that FortiWeb takes when a request violates the rule: • `alert`—Accept the request and generate an alert email and/or log message. • `alert_deny`—Block the request (or reset the connection) and generate an alert and/or log message. • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure `block-period <block-period_int>` (page 465). • `deny_no_log`—Deny a request. Do not generate a	`alert`

Variable	Description	Default
	log message. **Note:** If FortiWeb is deployed behind a NAT load balancer, when using this option, define an X-header that indicates the original client's IP. Failure to do so may cause FortiWeb to block all connections when it detects a violation of this type. For details, see "waf x-forwarded-for" on page 551. Attack log messages contain `Padding Oracle Attack` when this feature detects a possible attack. Because this attack involves some repeated brute force, the attack log may not appear immediately, but should occur within 2 minutes, depending on your configured DoS alert interval. **Caution:** This setting will be ignored if `monitor-mode {enable | disable}` (page 146) is enabled. **Note:** Logging and/or alert email occur only when the these features are enabled and configured. For details, see "log attack-log" on page 72 and "log alertMail" on page 71. **Note:** To use this rule set with auto-learning, select `alert`. If `action` is `alert_deny` or any other option that causes the FortiWeb appliance to terminate or modify the request or reply when it detects an attack attempt, the session information for auto-learning will be incomplete.	
`block-period <block-period_int>`	Enter the number of seconds that FortiWeb blocks subsequent requests from the client after it detects that the client has violated the rule. This setting is available only if `action {alert | alert_deny | block-period | deny_no_log}` (page 464) is `block-period`. The valid range is 1–4,294,967,295.	1
`severity {High | Medium | Low | Info}`	When rule violations are recorded in the attack log, each log message contains a Severity Level (`severity_level`) field. Specify the severity level FortiWeb uses when it logs a violation of this rule.	`Medium`
`trigger "<trigger-policy_name>"`	Enter the name of the trigger policy, if any, that the FortiWeb appliance uses when it logs and/or sends an alert email about a violation of the rule. For details, see "log trigger-policy" on page 105. To display the list of existing triggers, enter:	No default.

Variable	Description	Default
	`set trigger ?`	
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`host-status {enable | disable}`	Specify `enable` to apply this rule only to HTTP requests for specific web hosts. Also specify `host "<host_str>"` (page 466). Specify `disable` to match the rule based on the other criteria, such as the URL, but regardless of the `Host:` field.	`disable`
`host "<host_str>"`	Specify which protected host names entry (either a web host name or IP address) that the `Host:` field of the HTTP request must be in to match the rule. This option is available only if the value of `host-status {enable | disable}` (page 466) is `enabled`. Maximum length is 255 characters.	No default.
`url-type {plain | regular}`	Enter to determine how the value of `protected-url "<protected-url_str>"` (page 466) is specified: • `plain`—A literal URL. • `regular`—A regular expression designed to match multiple URLs.	`plain`

`protected-url "<protected-url_str>"`	If the value of `url-type {plain | regular}` (page 466) is `plain`, enter the literal URL that HTTP requests that match the rule contain.
	For example:
	`/profile.jsp`
	The URL must begin with a backslash (/).
	If the value of `url-type` is `regular`, specify a regular expression matching all and only the URLs to which the rule should apply.
	For example:
	`^/*\.jsp\?uid\=(.*)`
	The pattern does not require a slash (/).; however, it must at least match URLs that begin with a slash, such as `/profile.cfm`.
	Do not include the domain name, such as
		No default.

Variable	Description	Default
	`www.example.com`, which is specified by `host`. Regular expressions beginning with an exclamation point (`!`) are not supported. For information on language and regular expression matching, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides	
`target "<cookie parameter url>"`	Specify which parts of the client's requests FortiWeb examines for padding attack attempts: • `url`—A URL (for example, the parameter `/user/0000012FE03BC2` is embedded in the URL). • `parameter`—A parameter (for example, the parameter **/index.php?user=0000012FE03BC2** appended to a traditional GET or POST body). • `cookie`—A cookie.	`parameter`

Example

This example illustrates a padding oracle rule that blocks requests to the host `www.example.com` when a parameter appended in a traditional GET URL parameter or POST body matches the specified regular expression. When a request matches the expression, FortiWeb logs or sends a high-severity message as specified in the `notification-servers1` trigger policy.

```
config waf padding-oracle
  edit "padding-oracle1"
    set action block-period
    set block-period 3600
    set severity High
    set trigger "notification-servers1"
    config protected-url-list
      edit 1
        set host-status enable
        set host "www.example.com"
        set url-type regular
        set protected-url "\/profile\.jsp\?uid\=(.*)"
        set target parameter
        end
```

waf page-access-rule

Use this command to configure page access rules.

Page access rules define URLs that can be accessed only in a **specific order**, such as to enforce the business logic of a web application. Requests for other, non-ordered URLs may interleave ordered URLs during the client's session. Page access rules may be specific to a web host.

For example, an e-commerce application might be designed to work properly in this order:

1. A client begins a session by adding an item to a shopping cart (`/addToCart.do?*`).
2. The client either views and adds additional items to the shopping cart, or proceeds directly to the checkout.
3. The client confirms the items that he or she wants to purchase (`/checkout.do`).
4. The client provides shipping information (`/shipment.do`).
5. The client pays for the items and shipment, completing the transaction (`/payment.do`).

Sessions that begin at the shipping or payment stage should therefore be invalid. If the web application does not enforce this rule itself, it could be open to cross-site request forgery (CSRF) attacks on the payment feature. To prevent such abuse, the FortiWeb appliance could enforce the rule itself using a page access rule set with the following order:

1. `/addToCart.do?item=*`
2. `/checkout.do?login=*`
3. `/shipment.do`
4. `/payment.do`

Attempts to request `/payment.do` before those other URLs during a session would be denied, and generate an alert and attack log message. For details, see "log disk" on page 77.

To apply page access rules, select them within an inline protection profile. For details, see "waf web-protection-profile inline-protection" on page 528.

Before you configure a page access rule, if you want to apply it only to HTTP requests for a specific real or virtual host, you must first define the web host in a protected hosts group. For details, see "server-policy allow-hosts" on page 112.

You can use SNMP traps to notify you when a page access rule is enforced. For details, see "system snmp community" on page 301.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

In order for page access rules to be enforced, you must also enable `http-session-management {enable | disable}` (page 531) in the inline protection profile.

Syntax

```
config waf page-access-rule
   edit "<page-access-rule_name>"
   set page-severity {Low | Medium | High | Info}
   set page-trigger <page-trigger-policy_name>
```

```
config page-access-list
     edit <entry_index>
        set host "<protected-hosts_name>"
        set host-status {enable | disable}
        set request-file "<url_str>"
        set request-type {plain | regular}
     next
   end
 next
end
```

Variable	Description	Default
"<page-access-rule_name>"	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.
page-severity {Low | Medium | High | Info}	When rule violations are recorded in the attack log, each log message contains a **Severity Level** (`severity_level`) field. Select which severity level the FortiWeb appliance will use when it logs a violation of the rule: • Informative • Low • Medium • High The default value is **Medium**.	
page-trigger <page-trigger-policy_name>	Select which trigger, if any, that the FortiWeb appliance will use when it logs and/or sends an alert email about a violation of the rule.	
<entry_index>	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999. Page access rules should be added to the set in the order which clients will be permitted to access them. For example, if a client must access `/login.asp` before `/account.asp`, add the rule for `/login.asp` first.	No default.
host "<protected-hosts_name>"	Enter the name of a protected host that the `Host:` field of an HTTP request must be in order to match the page access rule. The maximum length is 255 characters. This setting applies only if `host-status {enable | disable}` (page 469) is `enable`.	No default.
host-status {enable | disable}	Enable to apply this page access rule only to HTTP requests for specific web hosts. Also configure `host "<protected-hosts_name>"` (page 469).	`disable`

Variable	Description	Default
	Disable to match the page access rule based upon the other criteria, such as the URL, but regardless of the `Host:` field.	
`request-file "<url_str>"`	Depending on your selection in `request-type {plain | regular}` (page 470), enter either: • The literal URL, such as `/cart.php`, that the HTTP request must contain in order to match the page access rule. The URL must begin with a slash (/). • A regular expression, such as `^/*.php`, matching all and only the URLs to which the page access rule should apply. The pattern is **not** required to begin with a slash (/). However, it must at least match URLs that begin with a slash, such as `/cart.cfm`. Do not include the name of the web host, such as `www.example.com`, which is configured separately in `host "<protected-hosts_name>"` (page 469). The maximum length is 255 characters. **Note:** Regular expressions beginning with an exclamation point (`!`) are not supported. For information on language and regular expression matching, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides	No default.
`request-type {plain | regular}`	Specify whether `request-file "<url_str>"` (page 470) will contain a literal URL (`plain`), or a regular expression designed to match multiple URLs (`regular`).	`plain`

Example

This example allows any request to www.example.com, as long as it follows the expected sequence within a session for the four key shopping cart URLs (`/addToCart.do`, `/checkout.do`, `/shipment.do`, then `/payment.do`).

```
config waf page-access-rule
  edit "page-access-rule1"
    config page-access-list
      edit 1
        set host "www.example.com"
        set host-status enable
        set request-file "/addToCart.do?item=*"
        set request-type regular
      next
      edit 2
        set host "www.example.com"
        set host-status enable
        set request-file "/checkout.do?login=*"
        set request-type regular
      next
      edit 3
```

```
            set host "www.example.com"
            set host-status enable
            set request-file "/shipment.do"
            set request-type plain
         next
         edit 4
            set host "www.example.com"
            set host-status enable
            set request-file "/payment.do"
            set request-type plain
         next
      end
   next
end
```

waf parameter-validation-rule

Use this command to configure parameter validation rules, each of which is a group of input rule entries.

To apply parameter validation rules, select them within an inline or Offline Protection profile. For details, see "waf web-protection-profile inline-protection" on page 528 and "waf web-protection-profile offline-protection" on page 541.

Before you can configure parameter validation rules, you must first configure one or more input rules. For details, see "waf input-rule" on page 435.

You can use SNMP traps to notify you when a parameter validation rule is enforced. For details, see "system snmp community" on page 301.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf parameter-validation-rule
   edit "<rule_name>"
      config input-rule-list
         edit <entry_index>
            set input-rule "<input-rule_name>"
         next
      end
   next
end
```

Variable	Description	Default
"<rule_name>"	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.
<entry_index>	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
input-rule "<input-rule_name>"	Enter the name of an input rule to use in the parameter validation rule. The maximum length is 63 characters. To display the list of existing input rules, enter: `set input-rule ?`	No default.

Example

This example configures a parameter validation rule that applies two input rules.

```
config waf parameter-validation-rule
   edit "parameter_validator1"
      config input-rule-list
         edit 1
            set input-rule "input_rule1"
      next
         edit 2
            set input-rule "input_rule2"
         next
      end
   next
end
```

- "waf web-protection-profile offline-protection" on page 541

waf signature

Use this command to configure web server protection rules.

There are several security features specifically designed to protect web servers from known attacks. You can configure defenses against:

- Cross-site scripting (XSS)
- SQL injection and many other code injection styles

- Remote file inclusion (RFI)
- Local file inclusion (LFI)
- OS commands
- Trojans/viruses
- Exploits
- Sensitive server information disclosure
- Credit card data leaks

To defend against known attacks, FortiWeb scans:

- Parameters in the URL of HTTP `GET` requests
- Parameters in the body of HTTP `POST` requests
- XML in the body of HTTP `POST` requests (if `xml-protocol-detection {enable | disable}` (page 532) is enabled)
- Cookies
- Headers
- JSON Protocol Detection
- Uploaded filename(MULTIPART_FORM_DATA_FILENAME)

In addition to scanning standard requests, signatures can also scan action message format 3.0 (AMF3) binary inputs used by Adobe Flash clients to communicate with server-side software and XML. For details, see `amf3-protocol-detection {enable | disable}` (page 532) and `malformed-xml-check {enable | disable}` (page 532) (for inline protection profiles) or `amf3-protocol-detection {enable | disable}` (page 544) (for Offline Protection profiles).

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Updating signatures

Known attack signatures can be updated. For details about uploading a new set of attack definitions, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

You can also create your own. For details, see "waf custom-protection-rule" on page 382.

Configuring signatures

Before configuring a server protection rule, if you want to configure your own attack or data leak signatures, you must also configure custom server protection rules. For details, see "waf custom-protection-group" on page 381.

Each server protection rule can be configured with the severity and notification settings ("trigger") that, in combination with the action, determines how FortiWeb handles each violation.

For example, attacks categorized as cross-site scripting and SQL injection could have the `action` set to `alert_deny`, the `severity` set to `High`, and a trigger set to deliver an alert email each time these rule violations are detected. Specific signatures in those categories, however, might be disabled, set to log/alert instead, or exempt requests to specific host names/URLs.

Alternatively, you can automatically configure a server protection rule that detects all attack types by generating a default auto-learning profile. For details, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

Overriding signature category configuration

To override category-wide actions for a specific signature, configure:

- `config signature_disable_list` (page 474)—Disable a specific signature ID (e.g. 040000007), even if the category in general (e.g. **SQL Injection (Extended)**) is enabled.
- `config sub_class_disable_list` (page 474)—Disable a subcategory of signatures (e.g. **Session Fixation**), even if the category in general (e.g. **General Attacks**) is enabled.
- `config alert_only_list` (page 474)—Only log/alert when detecting the attack, even if the category in general is configured to block.
- `config filter_list` (page 475)—Exempt specific host name and/or URL combinations from scanning with this signature.

Applying signature policies

To apply server protection rules, select them within an inline or Offline Protection profile. For details, see "waf web-protection-profile inline-protection" on page 528 and "waf web-protection-profile offline-protection" on page 541.

You can use SNMP traps to notify you when an attack or data leak has been detected. For details, see "system snmp community" on page 301.

Syntax

```
config waf signature
   edit "<signature-set_name>"
      set credit-card-detection-threshold <instances_int>
      set custom-protection-group "<group_name>"
      config main_class_list
         edit {010000000 | 020000000 | 030000000 | 040000000 | 050000000 | 060000000 |
             070000000 | 080000000 | 090000000 | 100000000 | 110000000 | 120000000}
            set action {alert |alert_deny | block-period |only_erase | send_http_response
                | alert_erase | redirect | deny_no_log}
            set block-period <seconds_int>
            set severity {Low | Medium | High | Info}
            set trigger "trigger-policy_name>"
         next
      end
      config signature_disable_list
         edit "<signature-id_str>"
         next
      end
      config sub_class_disable_list
         edit {010000000 | 020000000 | 030000000 | 040000000 | 050000000 | 060000000 |
             070000000 | 080000000 | 090000000 | 100000000 | 110000000 | 120000000}
         next
      end
      config alert_only_list
         edit "<alert-only-list_signature-id_str>"
```

```
        next
      end
      config fpm_disable_list
        edit "<fpm-disable-list_signature-id_str>"
        next
      end
      config scoring_override_disable_list
        edit "<scoring-override-disable-list_signature-id_str>"
        next
      end
      config score_grade_list
        edit "<score-grade-list_signature-id_str>"
          set scoring-grade {off | low | med | high | crit}
        next
      end
      config filter_list
        edit <entry_index>
          set signature_id "<signature-id_str>"
          set match-target {HTTP_METHOD | CLIENT_IP | HOST | URI | FULL_URL | PARAMETER
              | COOKIE | HTTP_HEADER}
          set operator {STRING_MATCH | REGEXP_MATCH | EQ | NE| INCLUDE | EXCLUDE}
          set http-method {get post head options trace connect delete put others patch}
          set ip {<ipv4> | <ipv6>}
          set name {"<name_str>" | "<name_pattern>"}
          set value-check {enable | disable}
          set value {"<value_str>" | "<value_pattern>"}
          set concatenate-type {AND | OR}
        next
      set comment "<comment_str>"
      end
    next
  end
```

Variable	Description	Default
"<signature-set_name>"	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.
credit-card-detection-threshold <instances_int>	Enter the number of credit cards that triggers the credit card number detection feature. For example, to ignore web pages with only one credit card number, but to detect when a web page containing two or more credit cards, enter `2`. The valid range is 1–128.	`1`
custom-protection-group "<group_name>"	Enter the name of the custom signature group to be used, if any. The maximum length is 63 characters. To display the list of existing custom signature groups,	No default.

Variable	Description	Default
	enter: `set custom-protection-group ?`	
`{010000000 | 020000000 | 030000000 | 040000000 | 050000000 | 060000000 | 070000000 | 080000000 | 090000000 | 100000000 | 110000000 | 120000000}`	Enter the ID of a signature class (or, for subclass overrides, the subclass ID). To display the list of signature classes, enter: `edit ?`	No default.
`action {alert |alert_deny | block-period |only_erase | send_http_response | alert_erase | redirect | deny_no_log}`	Select which action the FortiWeb appliance will take when it detects a signature match. **Note:** This is not a single setting. Available actions may vary slightly, depending on what is possible for each specific type of attack/information disclosure. • `alert`—Accept the request and generate an alert email and/or log message. **Note:** Does **not** cloak, except for removing sensitive headers. (Sensitive information in the body remains unaltered.) • `alert_deny`—Block the request (or reset the connection) and generate an alert email and/or log message. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure `block-period <seconds_int>` (page 477). **Note:** If FortiWeb is deployed behind a NAT load balancer, when using this option, you **must** also define an X-header that indicates the original client's IP. Failure to do so may cause FortiWeb to block **all** connections when it detects a violation of this type. For details, see "waf x-forwarded-for" on page 551. • `only_erase`—Hide sensitive information in replies from the web server (sometimes called "cloaking"). Block the request or remove the sensitive information, but do not generate an alert email and/or log message. **Caution:** This option is not supported in Offline Protection mode.	`alert`

Variable	Description	Default
	• `send_http_response`—Block and reply to the client with an HTTP error message, and generate an alert email, a log message, or both • `alert_erase`—Hide replies with sensitive information (sometimes called “cloaking”). Block the reply (or reset the connection) or remove the sensitive information, and generate an alert email and/or log message. • `deny_no_log`—Deny a request. Do not generate a log message. **Note:** This option is not fully supported in Offline Protection mode. Effects will be identical to `alert`; sensitive information will not be blocked or erased.	
	• `redirect`—Redirect the request to the URL that you specify in the protection profile and generate an alert email and/or log message. Also configure `redirect-url "<redirect_fqdn>"` (page 539) and `rdt-reason {enable | disable}` (page 539). **Caution:** FortiWeb ignores this setting if `monitor-mode {enable | disable}` (page 146) is enabled. **Note:** Actions that generate log messages alert email actions require the features to be enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71. **Note:** If you select an auto-learning profile in the policy with Offline Protection profiles that use this rule, select `alert`. If the `action` is `alert_deny`, the FortiWeb appliance resets the connection when it detects an attack and the session information for the auto-learning feature will be incomplete. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	
`block-period <seconds_int>`	Enter the number of seconds that you want to block subsequent requests from the client after the FortiWeb appliance detects that the client has violated the rule. The valid range is 1–3,600. The setting is applicable only if `action` is `period-block`. **Note:** This is not a single setting. You can configure the block period separately for each signature category.	`60`
`severity {Low | Medium | High | Info}`	When rule violations are recorded in the attack log, each log message contains a **Severity Level** (`severity_`	`Medium`

Variable	Description	Default
	`level`) field. Select which severity level the FortiWeb appliance will use when it logs a violation of the rule: • `Low` • `Medium` • `High` **Note:** This is not a single setting. You can configure the severity separately for each signature category.	
`trigger "trigger-policy_name>"`	Enter the name of the trigger, if any, to apply when a protection rule is violated. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing triggers, enter: `set trigger ?` **Note:** This is not a single setting. You can configure a different trigger for each signature category.	No default.
`"<signature-id_str>"`	Enter the ID of a specific signature that you want to disable. Some signatures often cause false positives and are disabled by default. To display a list, enter: `edit ?`	No default.
`"<alert-only-list_signature-id_str>"`	Enter the ID of a specific signature that generates logs or alert email only and does not block matching requests.	No default.
`"<fpm-disable-list_signature-id_str>"`	Enter the ID of a specific signature for which false positive mitigation is disabled. The false positive mitigation feature performs additional lexical and syntax analysis after a SQL injection signature matches a request.	No default.
`"<scoring-override-disable-list_signature-id_str>"`	Enter the ID of a specific signature that will not be affected by the threat weight settings in a device reputation security policy, if any. When traffic violates specified signature, FortiWeb takes the local action specified for that signature.	No default.
`"<score-grade-list_signature-id_str>"`	Enter the ID of a specific signature to configure its threat weight. Specify the `scoring-grade` to set the threat weight of the specified signature.	No default.
`scoring-grade {off | low | med | high |`	Specify the threat weight that the signature adds to the combined threat weight in the selected device reputation	No default.

Variable	Description	Default
crit}	security policy. Global threat weight risk level values can be modified using config server-policy pattern threat-weight (page 128).	
<entry_index>	Enter the index number of the individual entry in the table. The valid range is 1–128. You can create up to 128 exceptions for each signature.	No default.
signature_id "<signature-id_str>"	Enter the ID of a specific signature that you want to disable when the request matches the specified object.	No default.
match-target {HTTP_METHOD | CLIENT_IP | HOST | URI | FULL_URL | PARAMETER | COOKIE | HTTP_HEADER}	Enter the type of object that FortiWeb examines for matching values: • HTTP_METHOD—One or more HTTP methods specified by http-method {get post head options trace connect delete put others patch} (page 480). • CLIENT_IP—The IP address or IP range specified by ip {<ipv4> | <ipv6>} (page 480). • HOST—The Host: field value specified by value {"<value_str>" | "<value_pattern>"} (page 480). • URI—The URL value specified by value. The value does not include parameters. • FULL_URL—The URL value specified by value. The value includes parameters to match. • PARAMETER—A parameter specified by name {"<name_str>" | "<name_pattern>"} (page 480). To match a specific parameter value, enable value-check {enable | disable} (page 480), and then specify value. • COOKIE—A cookie specified by name. To match a specific cookie value, enable value-check, and then specify value.	
operator {STRING_MATCH | REGEXP_MATCH | EQ | NE| INCLUDE | EXCLUDE}	Enter the type of values to match. The match-target value determines which types are available. • STRING_MATCH—value is a literal value (for example, a literal host name). • REGEXP_MATCH—value is a regular expression that matches the object the exception applies to. • EQ—When match-target is CLIENT_IP, FortiWeb only performs a signature scan for requests with a client IP address that matches the value of ip. • NE—When match-target is CLIENT_IP, FortiWeb does not perform a signature scan for requests with a client IP address that matches the value of ip.	

Variable	Description	Default
	• INCLUDE—When match-target is HTTP_METHOD, FortiWeb does not perform a signature scan for requests that include the HTTP methods specified by http-method. • EXCLUDE—When match-target is HTTP_METHOD, FortiWeb only performs a signature scan for requests that include the HTTP methods specified by http-method.	
http-method {get post head options trace connect delete put others patch}	When match-target {HTTP_METHOD | CLIENT_IP | HOST | URI | FULL_URL | PARAMETER | COOKIE | HTTP_HEADER} (page 479) is HTTP_METHOD, specifies one or more HTTP methods to match.	No default.
ip {<ipv4> | <ipv6>}	When match-target {HTTP_METHOD | CLIENT_IP | HOST | URI | FULL_URL | PARAMETER | COOKIE | HTTP_HEADER} (page 479) is CLIENT_IP, specifies the IP address or IP range to match.	No default.
name {"<name_str>" | "<name_pattern>"}	Enter the name of a parameter or cookie to match. Whether the value is a literal value or a regular expression is determined by the value of operator {STRING_MATCH | REGEXP_MATCH | EQ | NE| INCLUDE | EXCLUDE} (page 479). Available when match-target {HTTP_METHOD | CLIENT_IP | HOST | URI | FULL_URL | PARAMETER | COOKIE | HTTP_HEADER} (page 479) is PARAMETER or COOKIE.	No default.
value-check {enable | disable}	Enable to specify whether matching requests match a specified parameter or cookie value as well as the specified parameter or cookie name.	disable
value {"<value_str>" | "<value_pattern>"}	Enter the value to match (for example, a Host: field value). Whether the value is a literal value or a regular expression is determined by the value of operator.	No default.
concatenate-type {AND | OR}	• AND—A matching request matches this entry in addition to other entries in the list. • OR—A matching request matches this entry or other entries in the list.	AND
comment "<comment_str>"	Enter a description or other comment.	No default.

Example

This example enables both the Trojans (070000000) and XSS (010000000) classes of signatures, setting them to result in attack logs with a severity_level field of High, and using the email and SNMP settings defined in

`notification-servers1`. It also enables use of custom attack and data leak signatures in the set named `custom-signature-group1`.

This example disables by ID a signature that is known to cause false positives (`080200001`). It also makes an exception (`config filter_list`) by ID for a specific signature (`070000001`) for a URL (`/virus-sample-upload`) on a host (`www.example.com`) that is used by security researchers to receive virus samples.

```
config waf signature
   edit "attack-signatures1"
      set custom-protection-group "custom-signature-group1"
      config main_class_list
         edit "010000000"
            set severity High
            set trigger "notification-servers1"
         next
         edit "070000000"
            set severity High
            set trigger "notification-servers1"
         next
      end
      config signature_disable_list
         edit "080200001"
         next
      end
      config filter_list
         edit 1
            set signature_id "070000001"
            set match-target HOST
            set value "www.example.com"
         next
         edit 2
            set signature_id "070000001"
            set match-target URI
            set value "/virus-sample-upload"
         next
      end
   next
end
```

waf signature_update_policy

Use this command to deploy new signature updates in alert mode.

Syntax

```
config waf signature_update_policy
     set status {enable | disable}
end
```

Variable	Description	Default
`status {enable | disable}`	Enable to list new signatures from the FDS update.	`disable`

Example

This example shows how to enable the option to show the new signature list from the FDS update.

```
config waf signature_update_policy
     set status enable
end
```

waf site-publish-helper authentication-server-pool

Use this command to create a pool of authentication server connections for use with a site publishing rule.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf site-publish-helper authentication-server-pool
   edit "<authentication-server-pool_name>"
        edit <entry_index>
           set server-type {ldap | radius}
           set ldap-server "<ldap-query_name>"
           set radius-server "<radius-query_name>"
           set rsa-securid {enable | disable}
      end
   next
end
```

Variable	Description	Default
`"<authentication-server-pool_name>"`	Enter the name of a new or existing authentication server pool. The maximum length is 63 characters. To display the list of existing pools, enter: `edit ?`	No default.

Variable	Description	Default
`<entry_index>`	Enter the index number of a new or existing server entry in the authentication server pool.	No default.
`server-type {ldap | radius}`	Set the server type to the server entry `<entry_index>`. Enter `ldap` for a LDAP server or `radius` for a RADIUS server.	`ldap`
`ldap-server "<ldap-query_name>"`	Set the name of the LDAP query to the server entry `<entry_index>` if you set the server entry as LDAP. For details, see "user ldap-user" on page 320.	No default.
`radius-server "<radius-query_name>"`	Set the name of the RADIUS query to the server entry `<entry_index>` if you set the server entry as RADIUS. For details, see "user radius-user" on page 327.	No default.
`rsa-securid {enable | disable}`	Specify whether FortiWeb authenticates clients using a username and a RSA SecurID authentication code only. Users are not required to enter a password. When this option is enabled, the authentication delegation options in the site publish rule are not available. Available only if `server-type {ldap | radius}` (page 483) is `radius` and `client-auth-method {html-form-auth | http-auth | client-cert-auth | saml-auth}` (page 489) is `html-form-auth`.	`disable`

Example

For an example, see "waf site-publish-helper rule" on page 485.

Related topics

- "waf site-publish-helper rule" on page 485

waf site-publish-helper keytab_file

Use this command to group together web applications that you want to publish.z

waf site-publish-helper policy

Use this command to group together web applications that you want to publish.

Before you configure site publishing policies, you must first define the individual sites that will be a part of the group. For details, see "waf site-publish-helper rule" on page 485.

To apply this policy, include it in an inline web protection profile. For details, see "waf web-protection-profile inline-protection" on page 528.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf site-publish-helper policy
   edit "<site-publish-policy_name>"
      set account-lockout {enable | disable}
      set max-login-failures <failures_int>
      set account-block-period <account-block-period_int>
      set within <within_int>
      set credential-stuffing-protection {enable | disable}
      set action {alert | alert_deny | block-period | deny_no_log}
      set block-period <block_period_int>
      set severity {high | medium | low | Info}
      set trigger "<trigger_policy>"
      config rule
         edit <entry_index>
            set rule-name "<site-publish-rule_name>"
         next
      end
   next
end
```

Variable	Description	Default
"<site-publish-policy_name>"	Enter the name of a new or existing policy. The maximum length is 63 characters. To display the list of existing policies, enter: `edit ?`	No default.
account-lockout {enable | disable}	Enable to prevent account cracking by locking an account out after several failures logging into FortiWeb.	disable
max-login-failures <failures_int>	Set the threshold of login failure. FortiWeb will trigger lockout to the account if number of login failure exceeds the threshold during the specified time period (within <within_int> (page 484)).	5
account-block-period <account-block-period_int>	Set the time period (in minutes) that FortiWeb locks out an account for. No more login is accepted for the locked account during the period.	60
within <within_int>	Set the time period (in minutes) for FortiWeb counting the login failures and judging lockout to accounts. Count of login failure of an account will be reset when the time period is up.	3
credential-stuffing-protection {enable | disable}	Enable to use FortiGuard's Credential Stuffing Defense database to prevent against credential stuffing attacks.	disable

Variable	Description	Default
`action {alert | alert_deny | block-period | deny_no_log}`	Set the action. The options are: • `alert`—Accept the request and generate an alert email and/or log message. • `alert_deny`—Block the request (or reset the connection) and generate an alert email and/or log message • `block-period`—Block subsequent requests from the client for a number of seconds. • `deny_no_log`—Deny a request. Do not generate a log message. You can customize the web page that returns to the client with the HTTP status code.	No default.
`block-period <block_period_int>`	If the `action {alert | alert_deny | block-period | deny_no_log}` (page 485) is `block-period`, set amount of time (in seconds) FortiWeb will block subsequent requests from the client. The valid range is 1–3600.	60
`severity {high | medium | low | Info}`	Set the severity of credential stuffing attacks.	No default.
`trigger "<trigger_policy>"`	Select the trigger policy, if any, to apply in the Site Publish policy. For details, see "log trigger-policy" on page 105.	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`rule-name "<site-publish-rule_name>"`	Enter the name of an existing rule.	No default.

Example

For an example, see "waf site-publish-helper rule" on page 485.

- "waf web-protection-profile inline-protection" on page 528

waf site-publish-helper rule

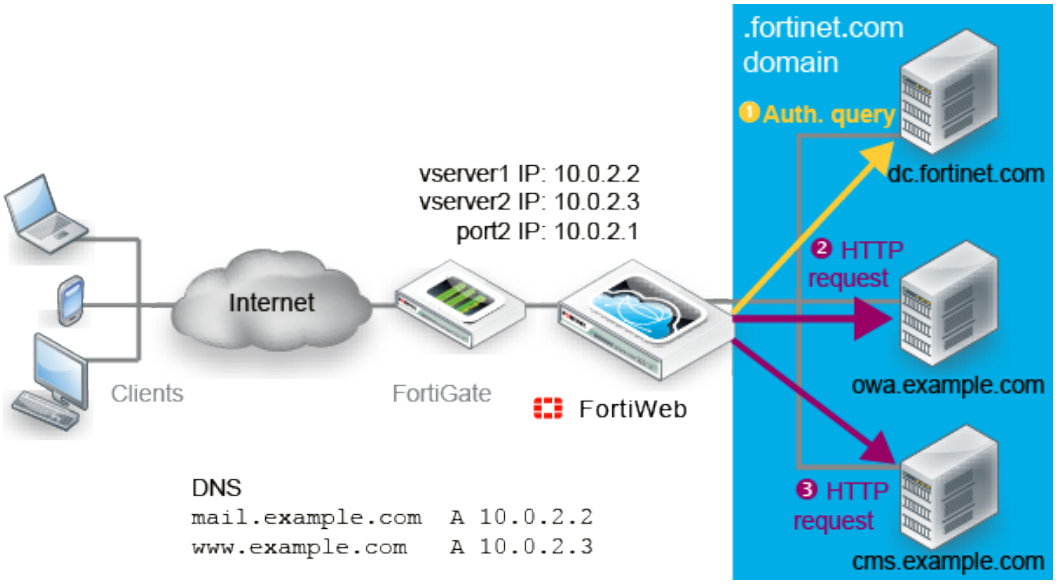
Use this command to configure access control, authentication, and, optionally, SSO for your web applications.

You may want to configure single sign-on (SSO) and combination access control and authentication (called “site publishing” in the GUI) instead of configuring simple HTTP authentication rules if:

- Your users access multiple web applications on your domain
- You have defined accounts centrally on an LDAP (such as Microsoft Active Directory) or RADIUS server

SSO provides a benefit over HTTP authentication rules: your users do not need to authenticate each time they access separate web applications in your domain. When FortiWeb receives the first request, it will return (depending on your configuration) an HTML authentication form or HTTP `WWW-Authenticate:` code to the client.

FortiWeb sends the client’s credentials in a query to the authentication server. Once the client is successfully authenticated, if the web application supports HTTP authentication and you have configured delegation, FortiWeb forwards the credentials to the web application. The server’s response is returned to the client. Until the session expires, subsequent requests from the client to the same or other web applications in the same domain do not require the client to authenticate..



For example, you may prefer SSO if you are using FortiWeb to replace your discontinued Microsoft Threat Management Gateway, using it as a portal for multiple applications such as SharePoint, Outlook Web Application, and/or IIS. Your users will only need to authenticate once while using those resources.

Before you configure site publishing, you must first define the queries to your authentication server. For details, see "user ldap-user" on page 320 and "server-policy custom-application application-policy" on page 1.

FortiWeb supports the following additional site publishing options:

- RADIUS authentication that requires users to provide a secondary password, PIN, or token code in addition to a username and password (two-factor authentication)
- RADIUS authentication that allows users to authenticate using their username and RSA SecurID token code only (no password)
- Regular Kerberos authentication delegation and Kerberos constrained delegation

For details about these options, see the descriptions of the individual site publishing rule settings and the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf site-publish-helper rule
   edit "<site-publish-rule_name>"
      set status {enable | disable}
      set req-type {plain | regular}
      set cookieless {enable | disable}
      set saml-server "<server_name>"
      set service-principal-name-pool "<pool_name>"
      set published-site "<host_fqdn>"
      set path "<url_str>"
      set client-auth-method {html-form-auth | http-auth | client-cert-auth | saml-
          auth}
      set logoff-path-type {plain | regular}
      set Published-Server-Logoff-Path "<url_str>"
      set cookie-timeout <timeout_int>
      set kerberos-type {krb5 | spnego}
      set auth-server-pool "<authentication-server-pool_name>"
      set auth-delegation {http-basic | kerberos  | kerberos-constrained-delegation |
          no-delegation | ntlm}
      set field-name {subject | SAN}
      set attribution-name {email | UPN}
      set pass-failed-auth {enable | disable}
      set delegated-spn "<delegated-spn_str>"
      set keytab-file <keytab_file>
      set delegator-spn "<delegator-spn_str>"
      set prefix-support {enable | disable}
      set prefix-domain "<prefix-domain_str>"
      set alert-type {all | fail | none | success}
      set sso-support {enable | disable}
      set sso-domain "<domain_str>"
      set cookieless {enable | disable}
      set append-custom-header {enable | disable}
      set custom-header-name <custom-header-name_str>
      set custom-header-value-format <custom-header-value-format_str>
      set pass-failed-auth {enable | disable}
      set cache-tgs-ticket {enable | disable}

   next
end
```

Variable	Description	Default
`"<site-publish-rule_name>"`	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: `edit ?`	No default.

Variable	Description	Default
`status {enable | disable}`	Enable to activate this rule. This can be used to temporarily deactivate access to a single web application without removing it from a site publishing policy.	`enable`
`req-type {plain | regular}`	Select whether `published-site "<host_fqdn>"` (page 488) contains a literal FQDN (`plain`), or a regular expression designed to match multiple host names or fully qualified domain names (`regular`).	`plain`
`cookieless {enable | disable}`	Enable to authenticate clients without using cookies.	`disable`
`saml-server "<server_name>"`	Select the SAML server that FortiWeb uses to authenticate clients. Available only when `client-auth-method {html-form-auth | http-auth | client-cert-auth | saml-auth}` (page 489) is set to `saml-auth`.	No default.
`service-principal-name-pool "<pool_name>"`	Select the SPN pool for the application that clients access using this site publish rule. Available only when `auth-delegation {http-basic | kerberos | kerberos-constrained-delegation | no-delegation | ntlm}` (page 490) is `kerberos` or `kerberos-constrained-delegation`.	No default.
`published-site "<host_fqdn>"`	Depending on your selection in `req-type {plain | regular}` (page 488), enter either: • The literal `Host:` name, such as `sharepoint.example.com`, that the HTTP request must contain in order to match the rule. • A regular expression, such as `^*\.example\.edu`, matching only the host names to which the rule should apply. The maximum length is 255 characters. **Note:** Regular expressions beginning with an exclamation point (`!`) are not supported. For information on language and regular expression matching, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides	No default.
`path "<url_str>"`	Enter the URL of the request for the web application, such as `/owa`. It must begin with a forward slash (/).	No default.

Variable	Description	Default
`client-auth-method {html-form-auth | http-auth | client-cert-auth | saml-auth}`	Specify one of the following options: • `html-form-auth`—FortiWeb authenticates clients by presenting an HTML web page with an authentication form. • `http-auth`—FortiWeb authenticates clients by providing an HTTP `AUTH` code so that the browser displays its own dialog.return an HTTP `AUTH` code so that the browser displays its own dialog. • `client-cert-auth`—FortiWeb validates the HTTP client's personal certificate using the certificate verifier specified in the associated server policy or server pool configuration. • `saml-auth`—FortiWeb uses a SAML server to pass identity information to a service provider via a signed XML document for client authentication. If `waf site-publish-helper rule` (page 485) is `enable`, only `http_auth` is allowed here.	`html-form-auth`
`logoff-path-type {plain | regular}`	Specify whether `Published-Server-Logoff-Path` contains a literal URL (`plain`), or a regular expression designed to match multiple URLs (`regular`).	
`Published-Server-Logoff-Path "<url_str>"`	This setting appears only if `client-auth-method {html-form-auth | http-auth | client-cert-auth | saml-auth}` (page 489) is `html-form-auth`. Depending on the value of `logoff-path-type`, enter one of the following values: • The literal URL of the request that a client sends to log out of the application (for example, `/owa/auth/logoff.aspx` . • A regular expression that matches the request that a client sends to log out of the application. Ensure that the value is a sub-path of the `path` value. For example, if `path` is `/owa`, `/owa/auth/logoff.aspx` is a valid value. When a client logs out of the web application, FortiWeb redirects the client to its authentication dialog. **Note:**Regular expressions beginning with an exclamation point (`!`) are not supported. For information on language and regular expression matching, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides	No default.
`cookie-timeout <timeout_int>`	Specify the length of time (in minutes) that passes before	0

Variable	Description	Default
	the cookie that the site publish rule adds expires and the client must re-authenticate. The valid range is 0–216,000. To disable the limit, enter `0`. If `waf site-publish-helper rule` (page 485) is `enable`, this must be `0`. If you enter a value of `0`, the browser only deletes the cookie when the user closes all browser windows.	
`auth-server-pool "<authentication-server-pool_name>"`	Enter the name of the pool of servers that FortiWeb uses to authenticate clients. For details, see "waf site-publish-helper authentication-server-pool" on page 482.	No default.
`auth-delegation {http-basic | kerberos | kerberos-constrained-delegation | no-delegation | ntlm}`	Specify one of the following options: • `http-basic`—Use HTTP `Authorization:` headers with Base64 encoding to forward the client's credentials to the web application. Typically, you should select this option if the web application supports HTTP **protocol**-based authentication. Available only if `client-auth-method {html-form-auth | http-auth | client-cert-auth | saml-auth}` (page 489) is `html-form-auth` or `http-auth`. • `kerberos`—After it authenticates the client via the HTTP form or HTTP basic method, FortiWeb obtains a Kerberos service ticket for the specified web application on behalf of the client. It adds the ticket to the HTTP `Authorization:` header of the client request with Base64 encoding. Available only if `client-auth-method` is `html-form-auth` or `http-auth`. • `kerberos-constrained-delegation`—After it authenticates the client's certificate, FortiWeb obtains a Kerberos service ticket for the specified web application on behalf of the client. It adds the ticket to the HTTP `Authorization:` header of the client request with Base64 encoding. Available only if `client-auth-method` is `client-cert-auth`. • `no-delegation`—FortiWeb does not send the client's credentials to the web application.	`no-delegation`

Variable	Description	Default
	Select this option when the web application has no authentication of its own or uses HTML form-based authentication. **Note:** If the web application uses HTML form-based authentication, the client is required to authenticate twice: once with FortiWeb and once with the web application's form. • `ntlm`—FortiWeb uses NT LAN Manager (NTLM) for authentication delegation. This is a challenge/response authentication protocol that FortiWeb uses to verify the identify of clients attempting to connect to the server(s). **Note**: If the `POST` method request triggers NTLM authentication, the request body cannot exceed 100M. If `waf site-publish-helper rule` (page 485) is `enable`, only `no_delegation` or `http-basic` is allowed here. Not available when `rsa-securid {enable | disable}` (page 483) is set to `enable`.	
`field-name {subject | SAN}`	Specify one of the following options to specify the certificate information that FortiWeb uses to determines the client username: • `subject`—The email address value in the certificate's Subject information. For `attribution-name {email | UPN}` (page 492), select `email`. • `SAN`—The certificate's subjectAltName (Subject Alternative Name or SAN) and either the User Principal Name (UPN) or the email address value in the certificate's Subject information. For `attribution-name`, enter `UPN` or `email`. In certificates issued in a Windows environment, the certificate's SAN and UPN contain the username. For example: `username@domain` Available only when `auth-delegation {http-basic | kerberos | kerberos-constrained-delegation | no-delegation | ntlm}` (page 490) is `kerberos-constrained-delegation`.	SAN

Variable	Description	Default
`attribution-name {email | UPN}`	Specify one of the following options to specify the certificate information that FortiWeb uses to determines the client username: • `email`—The email address value in the certificate's Subject information. For `field-name {subject | SAN}` (page 491), enter `subject` or `SAN`. • `UPN`—The User Principal Name (UPN) value. For `field-name`, enter `SAN`. **Note:** Because the email value can be an alias rather than the real DC (domain controller) domain, the most reliable method for determining the username is SAN and UPN. Available only when `auth-delegation {http-basic | kerberos | kerberos-constrained-delegation | no-delegation | ntlm}` (page 490) is `kerberos-constrained-delegation`.	UPN
`delegated-spn "<delegated-spn_str>"`	Specify the Service Principal Name (SPN) for the web application that clients access using this site publish rule. A service principal name uses the following format: `<service_type >/<instance_name>:<port_number>/ <service_name>` For example, for an Exchange server that belongs to the domain `dc1.com` and has the hostname `USER-U3LOJFPLH1`, the SPN is `http/USER-U3LOJFPLH1.dc1.com@DC1.COM`. Available only when `auth-delegation {http-basic | kerberos | kerberos-constrained-delegation | no-delegation | ntlm}` (page 490) is `kerberos` or `kerberos-constrained-delegation`.	No default.
`keytab-file <keytab_file>`	Specify the keytab file configuration for the AD user that FortiWeb uses to obtain Kerberos service tickets for clients. For details, see "waf site-publish-helper keytab_file" on page 483. Available only when `auth-delegation {http-basic | kerberos | kerberos-constrained-delegation | no-delegation | ntlm}` (page	No default.

Variable	Description	Default
	490) is `kerberos-constrained-delegation`.	
`delegator-spn "<delegator-spn_str>"`	Specify the Service Principal Name (SPN) that you used to generate the keytab specified by `keytab-file <keytab_file>` (page 492). This is the SPN of the AD user that FortiWeb uses to obtain a Kerberos service tickets for clients. Available only when `auth-delegation {http-basic | kerberos | kerberos-constrained-delegation | no-delegation | ntlm}` (page 490) is `kerberos-constrained-delegation`.	No default.
`prefix-support {enable | disable}`	Enable to allow users in environments that require users to log in using both a domain and username to log in with just a username. Also specify `prefix-domain "<prefix-domain_str>"` (page 493). In some environments, the domain controller requires users to log in with the username format `domain\username`. For example, if the domain is `example.com` and the username is `user1`, the user enters `EXAMPLE\user1`. Alternatively, enable this option and enter `EXAMPLE` for `prefix-domain "<prefix-domain_str>"` (page 493). The user enters `user1` for the username value and FortiWeb automatically adds `EXAMPLE\` to the HTTP `Authorization:` header before it forwards it to the web application. Available only when `auth-delegation {http-basic | kerberos | kerberos-constrained-delegation | no-delegation | ntlm}` (page 490) is `http-basic` or `kerberos`.	enable
`prefix-domain "<prefix-domain_str>"`	Enter a domain name that FortiWeb adds to the HTTP `Authorization:` header before it forwards it to the web application. Available only when `prefix-support {enable | disable}` (page 493) is enabled. If `auth-delegation {http-basic | kerberos | kerberos-constrained-delegation | no-delegation | ntlm}` (page 490) is `kerberos`, ensure that the string is the full domain name (for example, `example.com`).	No default.

Variable	Description	Default
`sso-domain "<domain_str>"`	Enter the domain suffix of `Host:` names that will be allowed to share this rule's authentication sessions, such as `.example.com`. Include the period (`.`) that precedes the host's name.	No default.
`sso-support {enable | disable}`	Enable for single sign-on support. For example, if this website is `www1.example.com` and the SSO domain is `.example.com`, once a client has authenticated with that site, it can access `www2.example.com` without authenticating a second time. Site publishing SSO sessions exist on FortiWeb only; they are not synchronized to the authentication and/or accounting server, and therefore SSO is not shared with non-web applications. For SSO with other protocols, consult the documentation for your FortiGate or other firewall. If `waf site-publish-helper rule` (page 485) is `enable`, this must be `disable`.	`disable`
`alert-type {all | fail | none | success}`	Specify which site publishing-related authentication events the FortiWeb appliance will log and/or send an alert email about. • `all` • `fail` • `success` • `none` Event log messages contain the user name, authentication type, success or failure, and source address (for example, `User jdoe [Site Publish] login successful from 172.0.2.5`) when an end-user successfully authenticates. A similar message is recorded if the authentication fails (for example, `User hackers [Site Publish] login failed from 172.0.2.5`). **Note:** Logging and/or alert email occurs only if it is enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71.	`none`
`cookieless {enable | disable}`	Enable to allow Android clients to access to Microsoft Exchange servers through Exchange ActiveSync protocol. **Note:** If this is enabled, these are restrictions are put in	`disable`

Variable	Description	Default
	place: • Only `http_auth` is allowed for `client-auth-method {html-form-auth | http-auth | client-cert-auth | saml-auth}` (page 489). • `sso-support {enable | disable}` (page 494) must be `disable`. • `cookie-timeout <timeout_int>` (page 489) must be `0`. • Only `no_delegation`, `http-basic` or `kerberos` is allowed for `auth-delegation {http-basic | kerberos | kerberos-constrained-delegation | no-delegation | ntlm}` (page 490).	
`kerberos-type {krb5 | spnego}`	Two kinds of authorization mechanisms are available, which are used by web servers to retrieve the Kerberos tickets. Available only when Authentication Delegation is Kerberos.	`spnego`
`pass-failed-auth {enable | disable}`	Enable it so that FortiWeb can be configured when Kerberos Constrained Delegation fails. Available only when `client-auth-method {html-form-auth | http-auth | client-cert-auth | saml-auth}` (page 489) is `client-cert-auth`, and `auth-delegation {http-basic | kerberos | kerberos-constrained-delegation | no-delegation | ntlm}` (page 490) `is kerberos-constrained-delegation.`	`disable`
`append-custom-header {enable | disable}`	Enable this option to forward the username to the back-end server in HTTP header.	`disable`
`custom-header-name <custom-header-name_str>`	Enter a name for the HTTP header. You can change it to any name as you desire, e.g. X-FWB-Uname, useraccount. Special characters are not supported.	`X-FWB-Username`
`custom-header-value-format <custom-header-value-format_str>`	Enter the format for the value, such as aaa-USERNAME-bbb, xxx-USERNAME, or USERNAME. Special characters are not supported. It must contain "USERNAME" in the value format. FortiWeb replaces the "USERNAME" with the actual username when forwarding the HTTP header to the back-end server.	`xxx-USERNAME-xxx`
`pass-failed-auth {enable | disable}`	This option is enabled automatically when the Authentication Delegation is Kerberos Constrained Delegation. When it is disabled and Kerberos Constrained Delegation fails, 500 and Account Failed Authentication pages will be returned.	`enable`
`cache-tgs-ticket {enable | disable}`	This option is enabled automatically when the Authentication Delegation is Kerberos Constrained Delegation or Kerberos to	`enable`

Variable	Description	Default
	control whether caching kerberos tgs ticket. When `pass-failed-auth {enable | disable}` (page 495) is disabled, this option will also be disabled.	

Example

This example configures a site publisher with SSO for both Outlook and Sharepoint on the `example.com` domain.

```
config waf site-publish-helper authentication-server-pool
   edit "LDAP server pool"
      edit 1
         set server-type ldap
         set ldap-server "LDAP query 1"
      end
   next
end
config waf site-publish-helper authentication-server-pool
   edit "RADIUS server pool"
      edit 1
         set server-type radius
         set ldap-server "RADIUS query 1"
      end
   next
end
config waf site-publish-helper rule
   edit "Outlook"
      set published-site "^*\.example\.edu"
      set auth-server-pool "LDAP server pool"
      set auth-delegation http-basic
      set sso-support enable
      set sso-domain ".example.edu"
      set path "/owa"
      set alert-type fail
      set Published-Server-Logoff-Path /owa/auth/logoff.aspx?Cmd=logoff
   next
   edit "Sharepoint"
      set published-site ^*\\.example\\.edu
      set req-type regular
      set auth-server-pool "RADIUS server pool"
      set auth-delegation http-basic
      set sso-support enable
      set sso-domain ".example.edu"
      set path "/sharepoint"
      set alert-type fail
   next
end
config waf site-publish-helper policy
   edit "example_com_apps"
      config rule
         edit 1
            set rule-name "Outlook"
         next
         edit 2
```

```
            set rule-name "Sharepoint"
          next
        end
      next
    end
```

waf staged_signature_list

Use this command to update the status of the signatures.

Syntax

```
config waf staged_signature_list
   edit signature_id <signature_id_int>
      set status {unapplied | applied | disabled}
end
```

Variable	Description	Default
`signature_id <signature_id_int>`	Select the ID that corresponds to the signature.	No default.
`status {unapplied | applied | disabled}`	Enable to select an action for the signature. **Disable**: disable the signature across all the web protection policies. If this signature related rule brings multiple blocks, you can confirm the false positive and enable this option. **Approve**: change the Alert mode of the signature to normal status, with the action as configured in signature protection policy. **Undo**: use this option to cancel the "Disable" and "Approve" operations for a signature.	No default.

Example

This example shows how to update the status of signatures from the FDS update.

```
config waf staged_signature_list
   edit 3
      set status applied
end
```

Related topics

- "waf signature_update_policy" on page 481

waf start-pages

Use this command to configure start page rules.

When a start page group is selected in the inline protection profile, HTTP clients must begin from a valid start page in order to initiate a valid session.

For example, you may wish to specify that HTTP clients of an e-commerce website must begin their session from either an item view or the first stage of the shopping cart checkout, and cannot begin a valid session from the third stage of the shopping cart checkout.

To apply start pages, select them within an inline protection profile. For details, see "waf web-protection-profile inline-protection" on page 528.

Before you configure a start page rule, if you want to apply it only to HTTP requests for a specific real or virtual host, you must first define the web host in a protected hosts group. For details, see "server-policy allow-hosts" on page 112.

You can use SNMP traps to notify you when a start page rule is enforced. For details, see "system snmp community" on page 301.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf start-pages
   edit "<start-page-rule_name>"
      set action {alert | alert_deny | block-period | redirect | send_403_forbidden |
          deny_no_log}
      set block-period <seconds_int>
      set severity {Low | Medium | High | Info}
      set trigger "<trigger-policy_name>"
      config start-page-list
         edit <entry_index>
            set host "<protected-hosts_name>"
            set host-status {enable | disable}
            set request-file "<url_str>"
            set request-type {plain | regular}
            set default {yes | no}
         next
      end
   next
end
```

Variable	Description	Default
"<start-page-rule_name>"	Enter the name of a new or existing rule. The maximum length is 63 characters.	No default.

Variable	Description	Default
	To display the list of existing rules, enter: `edit ?`	
`action {alert | alert_ deny | block-period | redirect | send_403_ forbidden | deny_no_log}`	Select one of the following actions that the FortiWeb appliance will perform when an HTTP request that initiates a session does not begin with one of the allowed start pages. • `alert`—Accept the request and generate an alert email and/or log message. • `alert_deny`—Block the request (or reset the connection) and generate an alert email and/or log message. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. • `block-period`—Block subsequent requests from the client for a number of seconds. Also configure `block-period <seconds_int>` (page 500). **Note:** If FortiWeb is deployed behind a NAT load balancer, when using this option, you **must** also define an X-header that indicates the original client's IP. Failure to do so may cause FortiWeb to block **all** connections when it detects a violation of this type. For details, see "waf x-forwarded-for" on page 551. • `redirect`—Redirect the request to the URL that you specify in the protection profile and generate an alert email and/or log message. Also configure `redirect-url "<redirect_fqdn>"` (page 539) and `rdt-reason {enable | disable}` (page 539). • `send_403_forbidden`—Reply to the client with an HTTP `403 Access Forbidden` error message and generate an alert email and/or log message. • `deny_no_log`—Deny a request. Do not generate a log message. **Caution:** This setting will be ignored if `monitor-mode {enable | disable}` (page 146) is enabled. **Note:** Logging and/or alert email will occur only if enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71. **Note:** If you select an auto-learning profile with this rule, you should select `alert`. If the `action` is `alert_deny`, for example, the FortiWeb appliance will block the request or	No default.

Variable	Description	Default
	reset the connection when it detects an attack, resulting in incomplete session information for the auto-learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	
`block-period <seconds_int>`	If `action {alert | alert_deny | block-period | redirect | send_403_forbidden | deny_no_log}` (page 499) is `block-period`, type, specify the number of seconds that the connection will be blocked. The valid range is 1–3,600.	1
`severity {Low | Medium | High | Info}`	Select the severity level to use in logs and reports generated when a violation of the rule occurs.	`Low`
`trigger "<trigger-policy_name>"`	Enter the name of the trigger to apply when this rule is violated. For details, see "log trigger-policy" on page 105. The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`host "<protected-hosts_name>"`	Enter the name of a protected host that the `Host:` field of an HTTP request must be in order to match the start page rule. The maximum length is 255 characters. This setting applies only if `host-status {enable | disable}` (page 500) is `enable`.	No default.
`host-status {enable | disable}`	Enable to apply this start page rule only to HTTP requests for specific web hosts. Also configure `host "<protected-hosts_name>"` (page 500). Disable to match the start page rule based upon the other criteria, such as the URL, but regardless of the `Host:` field.	`disable`
`request-file "<url_str>"`	Depending on your selection in `request-type {plain | regular}` (page 501), enter either: • The literal URL, such as `/index.php`, that the HTTP request must contain in order to match the start page rule. The URL must begin with a slash (/). • A regular expression, such as `^/*.php`, matching all and only the URLs to which the start page rule should apply. The pattern is **not** required to begin with a slash (/). However, it must at least match URLs that begin with a slash, such as	No default.

Variable	Description	Default
	`/index.cfm`. Do not include the name of the web host, such as `www.example.com`, which is configured separately in `host "<protected-hosts_name>"` (page 500). The maximum length is 255 characters. **Note:** Regular expressions beginning with an exclamation point (`!`) are not supported. For information on language and regular expression matching, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides	
`request-type {plain | regular}`	Select whether `request-file "<url_str>"` (page 500) will contain a literal URL (`plain`), or a regular expression designed to match multiple URLs (`regular`).	`plain`
`default {yes | no}`	Enter `yes` to use the page as the default for HTTP requests that either: • Do not specify a URL. • Do not specify the URL of a valid start page (only if you have selected `redirect` from `action`). Otherwise, enter `no`.	`no`

Example

This example redirects clients to the default start page, `/index.html`, if clients request a page that is not one of the valid start pages (`/index.html` or `/cart/login.jsp`). Redirection will occur only if the request is destined for one of the virtual or real hosts defined in the protected hosts group named `example_com_hosts`.

```
config waf start-pages
   edit "start-page-rule1"
      edit 1
         set host "example_com"
         set host-status enable
         set request-file "/index.html"
         set default yes
      next
      edit 2
         set host "example_com_hosts"
         set host-status enable
         set request-file "/cart/login.jsp"
         set default no
      next
   next
end
```

waf url-access url-access-policy

Use this command to configure a set of URL access rules that define HTTP requests that are allowed or denied.

Before using this command, you must first define your URL access rules. For details, see "waf url-access url-access-rule" on page 503.

To apply URL access policies, select them within an inline or Offline Protection profile. For details, see "waf web-protection-profile inline-protection" on page 528 or "waf web-protection-profile offline-protection" on page 541.

You can use SNMP traps to notify you when a URL access rule is enforced. For details, see "system snmp community" on page 301.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf url-access url-access-policy
   edit "<url-access-policy_name>"
      config rule
         edit <entry_index>
            set url-access-rule-name "<url-access-rule_name>"
         next
      end
   next
end
```

Variable	Description	Default
`"<url-access-policy_name>"`	Enter the name of the new or existing URL access policy. The maximum length is 63 characters. To display the list of existing policies, enter: `edit ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`url-access-rule-name "<url-access-rule_name>"`	Enter the name of the existing URL access rule to add to the policy. The maximum length is 63 characters.	No default.

Example

This example adds two rules to the policy, with the first one set to priority level 0, and the second one set to priority level 1. The rule with priority 0 would be applied first.

```
config waf url-access url-access-policy
   edit "URL-access-set2"
      config rule
         edit 1
            set url-access-rule-name "URL Access Rule 1"
         next
         edit 2
            set url-access-rule-name "Blocked URL"
         next
      next
   end
```

waf url-access url-access-rule

Use this command to configure URL access rules that define the HTTP requests that are allowed or denied based on their host name and URL.

Typically, for example, access to administrative panels for your web application should **only** be allowed if the client's source IP address is an administrator's computer on your private management network. Unauthenticated access from unknown locations increases risk of compromise. Best practice dictates that such risk should be minimized.

To apply URL access rules, first group them within a URL access policy. For details see, "waf url-access url-access-policy" on page 502.

You can use SNMP traps to notify you when a URL access rule is enforced. For details, see "system snmp community" on page 301.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf url-access url-access-rule
   edit "<url-access-rule_name>"
      set action {alert_deny | continue | pass | deny_no_log}
      set host "<protected-hosts_name>"
      set host-status {enable | disable}
      set severity {Informative | Low | Medium | High | Info}
      set trigger "<trigger-policy_name>"
      config match-condition
         edit <entry_index>
```

```
            set sip-address-check {enable | disable}
            set sip-address-type {sip | sdomain | source-domain}
            set sip-address-value "<client_ip>"
            set sdomain-type {"<ipv4>" | "<ipv6>"}
            set sip-address-domain "<fqdn_str>"
            set source-domain-type {simple-string | regex-expression}
            set source-domain "<source-domain_str>"
            set type {regex-expression | simple-string}
            set reg-exp "<object_pattern>"
            set reverse-match {yes | no}
          next
        end
      next
    end
```

Variable	Description	Default
"<url-access-rule_name>"	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: edit ?	No default.
action {alert_deny | continue | pass | deny_no_log}	Select which action the FortiWeb appliance will take when a request matches the URL access rule. • alert_deny—Block the request (or reset the connection) and generate an alert email and/or log message. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. • continue—Generate an alert and/or log message, then continue by evaluating any subsequent rules defined in the web protection profile. If no other rules are violated, allow the request. If multiple rules are violated, a single request will generate multiple attack log messages. For details, see "debug flow trace" on page 598. • pass—Allow the request. Do **not** generate an alert and/or log message. • deny_no_log—Deny a request. Do **not** generate a log message. **Caution:** This setting will be ignored if monitor-mode {enable | disable} (page 146) is enabled. **Note:** Logging and/or alert email will occur only if enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71. **Note:** If an auto-learning profile will be selected in the policy	pass

Variable	Description	Default
	with Offline Protection profiles that use this rule, you should select `pass`. If the `action` is `alert_deny`, the FortiWeb appliance will reset the connection when it detects an attack, resulting in incomplete session information for the auto-learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	
`host "<protected-hosts_name>"`	Enter the name of a protected host that the `Host:` field of an HTTP request must be in order to match the rule. The maximum length is 255 characters. This setting is used only if `host-status {enable | disable}` (page 505) is `enable`.	No default.
`host-status {enable | disable}`	Enable to require that the `Host:` field of the HTTP request match a protected hosts entry in order to match the rule. Also configure `host "<protected-hosts_name>"` (page 505).	`disable`
`severity {Informative | Low | Medium | High | Info}`	When rule violations are recorded in the attack log, each log message contains a **Severity Level** (`severity_level`) field. Select which severity level the FortiWeb appliance will use when a blacklisted IP address attempts to connect to your web servers: • Informative • Low • Medium • High • Info	`Low`
`trigger "<trigger-policy_name>"`	Select which trigger, if any, that the FortiWeb appliance will use when it logs and/or sends an alert email about a blacklisted IP address's attempt to connect to your web servers. The maximum length is 63 characters. For details, see "log trigger-policy" on page 105. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`sip-address-check {enable | disable}`	Enable to add the client's source IP address as a criteria for matching the URL access rule. Also configure `sip-address-type {sip | sdomain | source-domain}` (page 506) and the specific settings for each source address type.	`disable`

Variable	Description	Default
`sip-address-type {sip | sdomain | source-domain}`	• `sip`—Configure `sip-address-value "<client_ip>"` (page 506). • `sdomain`—Configure `sdomain-type {"<ipv4>" | "<ipv6>"}` (page 506) and `sip-address-domain "<fqdn_str>"` (page 506). • `source-domain`—Configure `source-domain-type {simple-string | regex-expression}` (page 506) and `source-domain "<source-domain_str>"` (page 506).	`sip`
`sip-address-value "<client_ip>"`	Enter one of the following values: • A single IP address that a client source IP must match, such as a trusted private network IP address (e.g. an administrator's computer, `172.16.1.20`). • A range or addresses (e.g., `172.22.14.1-172.22.14.255` or `10:200::10:1-10:200:10:100`). Available only if `sip-address-type {sip | sdomain | source-domain}` (page 506) is `sip`.	`0.0.0.0`
`sdomain-type {"<ipv4>" | "<ipv6>"}`	Specifies the type of IP address FortiWeb retrieves from the DNS lookup of the domain specified by `sip-address-domain "<fqdn_str>"` (page 506). Available only if `sip-address-type {sip | sdomain | source-domain}` (page 506) is `sdomain`.	No default.
`sip-address-domain "<fqdn_str>"`	Specifies the domain to match the client source IP after DNS lookup. Available only if `sip-address-type {sip | sdomain | source-domain}` (page 506) is `sdomain`.	No default.
`source-domain-type {simple-string | regex-expression}`	• `simple-string`—`source-domain` specifies a literal domain. • `regex-expression`—`source-domain` specifies a regular expression that is designed to match multiple URLs. Available only if `sip-address-type {sip | sdomain | source-domain}` (page 506) is `source-domain`.	`simple-string`
`source-domain "<source-domain_str>"`	Enter a literal domain or a regular expression that is designed to match multiple URLs. Available only if `sip-address-type {sip | sdomain | source-domain}` (page 506) is `sdomain`.	No default.
`type {regex-expression |`	Select how to use the text in `reg-exp "<object_`	No default.

Variable	Description	Default
simple-string}	pattern>" (page 507) to determine whether or not a request URL meets the conditions for this rule. • simple-string—The text is a string that request URLs must match exactly. • regular-expression—The text is a regular expression that defines a set of matching URLs.	
reg-exp "<object_ pattern>"	Depending on your selection in type {regex-expression | simple-string} (page 506) and reverse-match {yes | no} (page 507), type a regular expression that defines either all matching or all non-matching URLs. Then, also configure reverse-match {yes | no} (page 507). For example, for the URL access rule to match all URLs that begin with /wordpress, you could enter ^/wordpress, then, for reverse-match, enter no. The pattern is **not** required to begin with a slash (/). The maximum length is 255 characters. **Note:** Regular expressions beginning with an exclamation point (!) are not supported. Instead, use reverse-match {yes | no}.	No default.
reverse-match {yes | no}	Indicate how to use reg-exp "<object_pattern>" (page 507) when determining whether or not this rule's condition has been met. • no—If the simple string or regular expression **does** match the request URL, the condition is met. • yes—If the simple string or regular expression does **not** match the request URL, the condition is met. The effect is equivalent to preceding a regular expression with an exclamation point (!).	no

Example

This example defines two sets of URL access rules.

The first set, Blocked URL, defines two URL match conditions: one uses a simple string to match an administrative page, and the other uses a regular expression to match a set of dynamic URLs for statistics pages.

The second set, Allowed URL, defines a single match condition that uses a regular expression to match all dynamic forms of the index page.

Actual blocking or allowing of the URLs, however, would not occur until a policy applies these URL access rules, and sets an action that the FortiWeb appliance will perform when an HTTP request matches either rule set.

```
config waf url-access url-access-rule
```

```
    edit "Blocked URL"
       config match-condition
          edit 1
             set type simple-string
             set reg-exp "/admin.php"
          next
          edit 2
             set type regular-expression
             set reverse-match no
             set reg-exp "statistics.php*"
          next
       end
    next
    edit "Allowed URL"
       config match-condition
          edit 1
             set type regular-expression
             set reverse-match no
             set reg-exp "index.php*"
          next
       end
    next
end
```

waf url-rewrite url-rewrite-policy

Use this command to group URL rewrite rules.

Before you can configure a URL rewrite group, you must first configure any URL rewriting rules that you want to include. For details, see "waf url-rewrite url-rewrite-rule" on page 509.

To apply a URL rewriting group, select it in an inline protection profile. For details, see "waf web-protection-profile inline-protection" on page 528.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf url-rewrite url-rewrite-policy
   edit "<url-rewrite-group_name>"
      config rule
         edit <entry_index>
            set url-rewrite-rule-name "<url-rewrite-rule_name>"
            next
      end
   next
```

```
    end
```

Variable	Description	Default
"<url-rewrite-group_name>"	Enter the name of the URL rewriting rule group. The maximum length is 63 characters. To display the list of existing group, enter: `edit ?`	No default.
<entry_index>	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
url-rewrite-rule-name "<url-rewrite-rule_name>"	Enter the name of an existing URL rewriting rule that you want to include in the group. The maximum length is 63 characters.	No default.

waf url-rewrite url-rewrite-rule

Use this command to configure URL rewrite rules or to redirect requests.

Rewriting or redirecting HTTP requests and responses is popular, and can be done for many reasons.

Similar to error message cloaking, URL rewriting can prevent the disclosure of underlying technology or website structures to HTTP clients.

For example, when visiting a blog web page, its URL might be:

```
http://www.example.com/wordpress/?feed=rss2
```

Simply knowing the file name, that the blog uses PHP, its compatible database types, and the names of parameters via the URL could help an attacker to craft an appropriate attack for that platform. By rewriting the URL to something more human-readable and less platform-specific, the details can be hidden:

```
http://www.example.com/rss2
```

Aside from for security, rewriting and redirects can be for aesthetics or business reasons. Financial institutions can transparently redirect customers that accidentally request HTTP:

```
http://bank.example.com/login
```

to authenticate and do transactions on their secured HTTPS site:

```
https://bank.example.com/login
```

Additional uses could include:

- During maintenance windows, requests can be redirected to a read-only server.
- International customers can use global URLs, with no need to configure the back-end web servers to respond to additional HTTP virtual host names.
- Shorter URLs with easy-to-remember phrases and formatting are easier for customers to understand, remember, and return to.

Much more than their name implies, “URL rewriting rules” can do all of those things, and more:

- Redirect HTTP requests to HTTPS
- Rewrite the URL line in the header of an HTTP request
- Rewrite the `Host:` field in the header of an HTTP request
- Rewrite the `Referer:` field in the header of an HTTP request
- Redirect requests to another website
- Send a `403 Forbidden` response to a matching HTTP requests
- Rewrite the HTTP location line in the header of a matching redirect response from the web server
- Rewrite the body of an HTTP response from the web server

Rewrites/redirects are not supported in all modes. For details, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To use a URL rewriting rule, add it to a policy. For details, see "waf url-rewrite url-rewrite-policy" on page 508.

To use this command, your administrator account’s access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf url-rewrite url-rewrite-rule
   edit "<url-rewrite-rule_name>"
      set action {403-forbidden | redirect | redirect-301 | http-body-rewrite | http-
          header-rewrite | location-rewrite}
      set header-name "<header-name_str>"
      set header-status {enable | disable}
      set header-value "<header-value_str>"
      set host {<server_fqdn> | <server_ipv4> | <host_pattern>}
      set host-status {enable | disable}
      set host-use-pserver {enable | disable}
      set url "<replacement-url_str>"
      set url-status {enable | disable}
      set location "<location_str>"
      set location_replace "<location_str>"
      set referer-status {enable | disable}
      set referer "<referer-url_str>"
      set referer-use-pserver {enable | disable}
      set body_replace "<replacement_str>"
      config match-condition
         edit <entry_index>
            set content-filter {enable | disable}
            set content-type-set {text/html text/plain text/javascript application/xml
                (or)text/xml application/javascript application/soap+xml application/x-
                javascript}
```

```
            set HTTP-protocol {http | https}
            set is-essential {yes | no}
            set object {http-host | http-reference | http-url}
            set protocol-filter {enable | disable}
            set reg-exp "<object_pattern>"
            set reverse-match {yes | no}
          next
        end
      next
    end
```

Variable	Description	Default
"<url-rewrite-rule_name>"	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing rules, enter: edit ?	No default.
action {403-forbidden | redirect | redirect-301 | http-body-rewrite | http-header-rewrite | location-rewrite}	Specify one of the following values: • 403-forbidden—Send a 403 (Forbidden) response to the client. • redirect—Send a 302 (Moved Temporarily) response to the client, with a new Location: field in the HTTP header. • redirect-301—Send a 301 (Moved Permanently) response to the client, with a new Location: field in the HTTP header. • http-body-rewrite—Replace the specific HTTP content in the body of responses. • http-header-rewrite—Rewrite the host, referer and request URL fields in HTTP header. • location-rewrite—Rewrite the location string in a 302 redirect.	http-header-rewrite
header-name "<header-name_str>"	Enter the name of the header field that you want to insert to a request, such as "Myheader."	No default.
header-status {enable | disable}	Enable to insert the specified header and value to the matched HTTP requests. Specifies the header name and header value through header-name "<header-name_str>" (page 511) and header-value "<header-value_str>" (page 511), respectively.	disable
header-value "<header-value_str>"	Enter the value of the header field that you specified in header-name "<header-name_str>" (page 511), such as "123." Then, the customized header Myheader: 123 will be inserted to the matched HTTP requests.	No default.
host {<server_fqdn> | <server_ipv4> | <host_	Type the FQDN of the host, such as store.example.com,	No default.

Variable	Description	Default

`pattern>}`	to which the request will be redirected. The maximum length is 255 characters.
	
	This option is available only when `host-status {enable | disable}` (page 512) is enabled and `action {403-forbidden | redirect | redirect-301 | http-body-rewrite | http-header-rewrite | location-rewrite}` (page 511) is `http-header-rewrite`.
	
	This field supports back references such as `$0` to the parts of the original request that matched any capture groups that you entered in `reg-exp "<object_pattern>"` (page 516) for each object in the condition table. (A capture group is a regular expression, or part of one, surrounded in parentheses.)
	
	Use `$`**n** (0 <= **n** <= 9) to invoke a substring, where **n** is the order of appearance of the regular expression, from left to right, from outside to inside, then from top to bottom.
	
	For example, regular expressions in the condition table in this order:
	
	`(a)(b)(c(d))(e)`
	
	`(f)`
	
	would result in invokable variables with the following values:
	
	• `$0`—a
	• `$1`—b
	• `$2`—cd
	• `$3`—d
	• `$4`—e
	• `$5`—f	

`host-status {enable | disable}`	Enable to rewrite the `Host:` field or host name part of the `Referer:` field. When disabled, the FortiWeb appliance preserves the value from the client's request when rewriting it. This option is available only when `action {403-forbidden | redirect | redirect-301 | http-body-rewrite | http-header-rewrite | location-rewrite}` (page 511) is `http-header-rewrite`.	`disable`
`host-use-pserver {enable | disable}`	Enable this when you have a server farm for server balance	`disable`

Variable	Description	Default
	or content routing. In this case you do not know which server in the server farm the FortiWeb appliance will use. When FortiWeb processes the request, it sets the value for the actual host. This option is available only when `host-status {enable | disable}` (page 512) is enabled and `action {403-forbidden | redirect | redirect-301 | http-body-rewrite | http-header-rewrite | location-rewrite}` (page 511) is `http-header-rewrite`. Any setting you make for `host` is ignored.	
`url "<replacement-url_str>"`	Enter the string, such as `/catalog/item1`, that will replace the request URL. The maximum length is 255 characters. This option is available only when `url-status {enable | disable}` (page 513) is enabled and `action {403-forbidden | redirect | redirect-301 | http-body-rewrite | http-header-rewrite | location-rewrite}` (page 511) is `http-header-rewrite`. Do not include the name of the web host, such as `www.example.com`, nor the protocol, which are configured separately in `host {<server_fqdn> | <server_ipv4> | <host_pattern>}` (page 511). Like `host`, this field supports back references such as `$0` to the parts `reg-exp "<object_pattern>"` (page 516) for each object in the condition table. For an example, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides	No default.
`url-status {enable | disable}`	Enable to rewrite the URL part of the request URL. If you disable this option, the FortiWeb appliance preserves the value from the client's request when it rewrites it. This option is available only when `action {403-forbidden | redirect | redirect-301 | http-body-rewrite | http-header-rewrite | location-rewrite}` (page 511) is `http-header-rewrite`.	`disable`
`location "<location_str>"`	Enter the replacement value for the `Location:` field in the HTTP header for the 302 response. The maximum length is 255 characters. This option is available only when `action {403-`	No default.

Variable	Description	Default
	`forbidden | redirect | redirect-301 | http-body-rewrite | http-header-rewrite | location-rewrite}` (page 511) is `redirect`.	
`location_replace "<location_str>"`	Enter the URL string that provides a location for use in a 302 HTTP redirect response from a web server connected to FortiWeb. The maximum length is 255 characters. This option is available only when `action {403-forbidden | redirect | redirect-301 | http-body-rewrite | http-header-rewrite | location-rewrite}` (page 511) is `location-rewrite`.	No default.
`referer-status {enable | disable}`	Enable to rewrite the `Referer:` field in the HTML header. Also configure `referer "<referer-url_str>"` (page 514) and `referer-use-pserver {enable | disable}` (page 514).	`disable`
`referer "<referer-url_str>"`	Enter the replacement value for the `Referer:` field in the HTML header. The maximum length is 255 characters. This option is available only when `referer-status {enable | disable}` (page 514) is enabled.	No default.
`referer-use-pserver {enable | disable}`	Enable this when you have a server farm for server balance or content routing. In this case you do not know which server in the server farm the FortiWeb appliance will use. When FortiWeb processes the request, it sets the value for the actual referrer. This option is available only when `referer-status {enable | disable}` (page 514) is enabled and `action {403-forbidden | redirect | redirect-301 | http-body-rewrite | http-header-rewrite | location-rewrite}` (page 511) is `http-header-rewrite`. Any setting you make for `referer "<referer-url_str>"` (page 514) is ignored.	`disable`
`body_replace "<replacement_str>"`	Enter the value that will replace matching HTTP content in the body of responses. The maximum is 255 characters. For an example, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides This option is available only when `action {403-forbidden | redirect | redirect-301 | http-body-rewrite | http-header-rewrite | location-rewrite}` (page 511) is `http-body-rewrite`.	No default.

Variable	Description	Default
<entry_index>	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
content-filter {enable | disable}	Enable if you want to match this condition only for specific HTTP content types (also called Internet or MIME file types) such as text/html, as indicated in the Content-Type: HTTP header. Also configure content-type-set {text/html text/plain text/javascript application/xml (or)text/xml application/javascript application/soap+xml application/x-javascript} (page 515).	disable
content-type-set {text/html text/plain text/javascript application/xml (or)text/xml application/javascript application/soap+xml application/x-javascript}	Enter the HTTP content types that you want to match in a space-delimited list, such as: set content-type-set text/html text/plain	No default.
HTTP-protocol {http | https}	Select which protocol will match this condition, either HTTP or HTTPS. This option is applicable only if protocol-filter {enable | disable} (page 516) is set to enable.	http
is-essential {yes | no}	Select what to do if there is no Referer: field, either: • no—Meet this condition. • yes—Do not meet this condition. Requests can lack a Referer: field for several reasons, such as if the user manually types the URL, and the request does not result from a hyperlink from another website, or if the URL resulted from an HTTPS connection. In those cases, the field cannot be tested for a matching value. For details, see the RFC 2616 section on the Referer: field (http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html). This option appears only if object {http-host | http-reference | http-url} (page 515) is http-reference.	yes
object {http-host | http-reference | http-url}	Select which part of the HTTP request to test for a match: • http-host • http-url • http-reference (the Referer: field)	http-host

Variable	Description	Default
	If the request must match multiple conditions (for example, it must contain both a matching `Host:` field and a matching URL), add each object match condition to the condition table separately.	
`protocol-filter {enable | disable}`	Enable if you want to match this condition only for either HTTP or HTTPS. Also configure `HTTP-protocol {http | https}` (page 515). For example, you could redirect clients that accidentally request the login page by HTTP to a more secure HTTPS channel—but the redirect is not necessary for HTTPS requests. As another example, if URLs in HTTPS requests should be exempt from rewriting, you could configure the rewriting rule to apply only to HTTP requests.	`disable`
`reg-exp "<object_pattern>"`	Depending on your selection in `object {http-host | http-reference | http-url}` (page 515) and `reverse-match {yes | no}` (page 516), type a regular expression that defines either all matching or all non-matching `Host:` fields, URLs, or `Referer:` fields. Then, also configure `reverse-match {yes | no}`. For example, for the URL rewriting rule to match all URLs that begin with `/wordpress`, you could enter `^/wordpress`, then, in `reverse-match {yes | no}`, select `no`. The pattern is **not** required to begin with a slash (/). The maximum length is 255 characters. **Note:** Regular expressions beginning with an exclamation point (`!`) are not supported. Instead, use `reverse-match {yes | no}`.	No default.
`reverse-match {yes | no}`	Indicate how to use `reg-exp "<object_pattern>"` (page 516)when determining whether or not this URL rewriting condition has been met. • `no`—If the regular expression **does** match the request object, the condition is met. • `yes`—If the regular expression does **not** match the request object, the condition is met. The effect is equivalent to preceding a regular expression with an exclamation point (`!`). If all conditions are met, the FortiWeb appliance will do your selected `action {403-forbidden | redirect |`	`no`

Variable	Description	Default
	`redirect-301 | http-body-rewrite | http-header-rewrite | location-rewrite}` (page 511).

- "waf url-rewrite url-rewrite-policy" on page 508

waf user-tracking policy

Use this command to group user tracking rules, which track sessions by user and capture a username to reference in traffic and attack log messages.

Before you configure a user-tracking policy, define the rules to add. For details, see "waf user-tracking rule" on page 518.

To apply a user tracking policy, you select it in an inline or Offline Protection profile. For details, see "waf web-protection-profile inline-protection" on page 528 and "waf web-protection-profile offline-protection" on page 541.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf user-tracking policy
   edit "<user-tracking-policy_name>"
      config input-rule-list
         edit <entry_index>
            set input-rule "<input-rule_name>"
         next
      end
   next
end
```

Variable	Description	Default
`"<user-tracking-policy_name>"`	Enter the name of a new or existing policy. The maximum length is 63 characters. To display the list of existing policies, enter: `edit ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`input-rule "<input-rule_name>"`	Enter the name of an existing rule.	No default.

waf user-tracking rule

Use this command to configure FortiWeb to track sessions by user and capture a username to reference in traffic and attack log messages.

When FortiWeb detects users that match the criteria that you specify in a user tracking policy, it stores the session ID and username.

To apply a user tracking rule, add it to a user tracking policy that you can select in an inline or Offline Protection profile. For details, see "waf user-tracking policy" on page 517.

You can apply a user tracking policy using either an inline or Offline Protection profile. However, in Offline Protection mode, `session-fixation-protection`, `session-timeout-enforcement`, and the deny, redirect and period block actions are not supported.

You can also use the user tracking feature to create a filter in a custom rule that matches specific users. This type of custom rule requires you to create a user tracking policy and apply it to the protection profile that uses the custom rule. For details, see "waf custom-access rule" on page 368.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf user-tracking rule
   edit "<rule_name>"
      set hostname-ip "<hostname-ip_str>"
      set host-status { enable | disable}
      set authentication-url "<url_str>"
      set username-parameter "<username_str>"
      set password-parameter "<password_str>"
      set session-id-name "<session-id_str>"
      set logoff-path "<logoff_str>"
      set session-fixation-protection {enable | disable}
      set session-timeout-enforcement {enable | disable}
      set session-timeout <timeout_int>
      set session-frozen-time <frozen-time_int>
      set session-frozen-action {alert | alert_deny | redirect | block-period | deny_no_
          log}
      set session-frozen-block-period <block-period_int>
      set session-frozen-severity {High | Medium | Low | Info}
      set session-frozen-trigger "<trigger-policy_name>"
      set default-action {failed | success}
      set credential-stuffing-protection {enable | disable}
         config match-condition
            edit <entry_index>
               set authentication-result-type {failed | success}
               set HTTP-match-target {return-code | response-body | redirect-url}
               set value-type {plain | regular}
               set value "<value-str>"
            next
         end
   next
end
```

Variable	Description	Default
"<rule_name>"	Enter a name that identifies the rule. You will use this name to reference the rule in other parts of the configuration. The maximum length is 63 characters.	No default.
hostname-ip "<hostname-ip_str>"		No default.
host-status { enable | disable}		No default.
authentication-url "<url_str>"	Enter the URL to match in authorization requests. Ensure that the value begins with a forward slash (/).	No default.
username-parameter "<username_str>"	Enter the username field value to match in authorization requests.	No default.
password-parameter "<password_str>"	Enter the password field value to match in authorization requests.	No default.
session-id-name "<session-id_str>"	Enter the name of the session ID that is used to identify each session. Examples of session ID names are sid, PHPSESSID, and JSESSIONID	No default.
logoff-path "<logoff_str>"	Optionally, enter the URL of the request that a client sends to log out of the application. When the client sends this URL, FortiWeb stops tracking the user session. Ensure that the value begins with a forward slash (/).	No default.
session-fixation-protection {enable | disable}	Enter enable to configure FortiWeb to erase session IDs from the cookie and argument fields of a matching login request. FortiWeb erases the IDs for non-authenticated sessions only. For web applications that do not renew the session cookie when a user logs in, it is possible for an attacker to trick a user into authenticating with a session ID that the attacker acquired earlier. This feature prevents the attacker from accessing the web app in an authenticated session. When this feature removes session IDs, FortiWeb does not generate a log message because it is very common for a legitimate user to access a web application using an existing cookie. For example, a client who leaves his or her web	disable

Variable	Description	Default
	browser open between sessions presents the cookie from an earlier session. **Caution:** This option is not supported in Offline Protection mode.	
`session-timeout-enforcement {enable | disable}`	Enter `enable` to configure FortiWeb to remove the session ID for user sessions that are idle for longer than the length of time specified by `session-timeout`. When a session is reset, the client has to log in again to access the back-end server. If a session exceeds the timeout threshold, instead of tracking subsequent matching sessions by user, FortiWeb takes the specified action, for a length of time specified by `session-frozen-time`.	`disable`
`session-timeout <timeout_int>`	Enter the length of time in minutes that FortiWeb waits before it stops tracking an inactive user session. The valid range is 1–14,400.	`30`
`session-frozen-time <frozen-time_int>`	Enter the length of time after a session exceeds the timeout threshold that FortiWeb takes the specified action against requests with the ID of the timed-out session. After the freeze time has elapsed, FortiWeb removes the session ID for idle sessions but no longer takes the specified action. Available only when `session-timeout-enforcement {enable | disable}` (page 520) is `enable`.	`30`
`session-frozen-action {alert | alert_deny | redirect | block-period | deny_no_log}`	When `session-timeout-enforcement {enable | disable}` (page 520) is `enable`, enter the action that FortiWeb takes against requests with the ID of a timed-out session during the specified time period, or when `credential-stuffing-protection {enable | disable}` (page 522) is enabled enter the action that FortiWeb takes against spilled username/password pairs: • `alert`—Accept the request and generate an alert email and/or log message. • `alert_deny`—Block the request and generate an alert email and/or log message. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296.	`alert`

Variable	Description	Default
	Note: In Offline Protection mode, because the deny action is not supported, this option has the same effect as `alert`. • `redirect` — Redirect the request to the URL that you specify in the protection profile and generate an alert and/or log message. Also configure `redirect-url <redirect_fqdn>` and `rdt-reason {enable | disable}`. **Caution:** This option is not supported in Offline Protection mode • `block-period`—Block subsequent requests from the client for a specified number of seconds. `deny_no_log`—Deny a request. Do not generate a log message. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. **Caution:** This option is not supported in Offline Protection mode When the action generates a log message, the message field value is `Session Timeout Enforcement: triggered by user <username>`. Available only when `session-timeout-enforcement {enable | disable}` (page 520) or `credential-stuffing-protection {enable | disable}` (page 522) is set to `enable`.	
`session-frozen-block-period <block-period_int>`	Enter the number of seconds to block requests with the ID of a timed-out session or when `credential-stuffing-protection {enable | disable}` (page 522) is enabled and detects spilled username/password pairs. This setting is available only if `session-frozen-action {alert | alert_deny | redirect | block-period | deny_no_log}` (page 520) is `block-period`. The valid range is 1–3,600.	`60`
`session-frozen-severity {High | Medium | Low | Info}`	When the session timeout settings generate an attack log, each log message contains a **Severity Level** (`severity_level`) field. Select which severity level FortiWeb uses when it takes the specified action: • `Low` • `Medium`	`Low`

Variable	Description	Default
	• `High` Available only when `session-timeout-enforcement {enable | disable}` (page 520) or `credential-stuffing-protection {enable | disable}` (page 522) is set to `enable`.	
`session-frozen-trigger "<trigger-policy_name>"`	Enter the name of the trigger, if any, to apply when FortiWeb detects requests with the ID of a timed-out session or when `credential-stuffing-protection` is enabled and FortiWeb detects spilled username/password pairs. The maximum length is 63 characters. For details, see "log trigger-policy" on page 105. To display the list of existing triggers, enter: `set trigger ?`	No default.
`default-action {failed | success}`	Enter the authentication result that FortiWeb associates with requests that match the criteria but do not match an entry in the Authentication Result Condition Table. When the login result is successful, FortiWeb tracks the session using the session ID and username values.	`failed`
`credential-stuffing-protection {enable | disable}`	Enable to use FortiGuard's Credential Stuffing Defense database to prevent against Credential Stuffing attacks. For details, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides	`disable`
`<entry_index>`	Enter the index number of the individual entry in the table.	No default.
`authentication-result-type {failed | success}`	Specify the status FortiWeb assigns to user logins that match this table item: `failed` or `successful`. FortiWeb tracks sessions by user only when the status is `successful`. If the request does not match any rules in this table, FortiWeb uses the value specified by `default-action {failed | success}` (page 522).	`success`
`HTTP-match-target {return-code | response-body | redirect-url}`	Select the location of the value to match with the string or regular expression specified in this table item: `return-code`, `response-body`, `redirect-url`.	`return-code`
`value-type {plain | regular}`	Indicate whether `value` is a simple string (`plain`) or a regular expression (`regular`).	`plain`
`value "<value-str>"`	Enter the value to match.	No default.

Example

This example matches requests from clients using the URL `/login2` with the parameters `user` and `pass` and a session ID specified by `jsessionid`. FortiWeb tracks matching sessions by user and stops tracking if the client logs out using the URL `/logout2`.

FortiWeb tracks only requests with the return code 200, which it classifies as successful. It does not track requests with a response body that matches the regular expression `deny`. In addition, because the rule uses the default value for the default authentication result, it does not track requests that do not match an item in the list of match conditions.

The rule enables both session fixation protection and session timeout enforcement for tracked sessions. If a session is idle longer than the default session timeout, FortiWeb blocks requests from clients that use the session ID that has timed out for the default period block time. It performs this action for 30 minutes after the session times out (the default session freeze time).

```
config waf user-tracking
   edit "rule1"
      set authentication-url "/login2"
      set username-parameter user
      set password-parameter pass
      set session-id-name "jsessionid"
      set logoff-path "/logout2"
      set session-fixation-protection enable
      set timeout-enforcement enable
      set session-frozen-action period-block
      set session-frozen-severity High
      set session-frozen-trigger "trigger1"
      config match-condition
         edit 1
            set authentication-result-type success
            set HTTP-match-target return-code
            set value-type plain
            set value 200
         next
         edit 2
            set authentication-result-type failed
            set HTTP-match-target return
            set value-type regular
            set value deny
         next
      end
   next
end
```

waf web-cache-exception

Use this command to configure FortiWeb to cache responses from your servers.

Use `web-cache-exception` to cache all URLs except for a few. To cache only a few URLs, see "waf web-cache-policy" on page 526.

To apply this policy, include it in an inline protection profile. For details, see "waf web-protection-profile inline-protection" on page 528.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf web-cache-exception
   edit "<web-cache-exception_rule_name>"
      config exception-list
         edit <entry_index>
            set host-status {enable | disable}
            set host "<host_str>"
            set url-type {plain | regular}
            set url-patten "<url-pattern_str>"
            set cookie-name "<cookie-name_str>"
      end
   next
end
```

Variable	Description	Default
`"<web-cache-exception_rule_name>"`	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing policies, enter: `edit ?`	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`host-status {enable | disable}`	Specify `enable` to require that the `Host:` field of the HTTP request match a protected host names entry in order to match the exception. Also specify a value for `host`.	`disable`
`host "<host_str>"`	Specify which protected host names entry (either a web host name or IP address) that the `Host:` field of the HTTP request must be in to match the exception. Maximum length is 255 characters. This option is available only if the value of `host-status {enable | disable}` (page 524) is `enabled`.	No default.

Variable	Description	Default
`url-type {plain | regular}`	Specify the type of value that is used for `url-patten "<url-pattern_str>"` (page 525): • `plain`—A literal URL. • `regular` — A regular expression designed to match multiple URLs.	`plain`
`url-patten "<url-pattern_str>"`	If the value of `url-type {plain | regular}` (page 525) is `plain`, specify the literal URL, such as `/index.php`, that the HTTP request must contain in order to match the rule. The URL must begin with a slash (/). If the value of `url-type` is `regular`, specify a regular expression, such as `^/*.php`, that matches all and only the URLs that the rule applies to. The pattern does not require a slash (/); however, it must match URLs that begin with a slash, such as `/index.cfm`. Do not include the domain name, such as `www.example.com`, which is specified by `host`. Maximum length is 255 characters. **Tip:** Generally, URLs that require autolearning adapters do not work well with caching either. Do not cache dynamic URLs that contain variables such as user names (e.g. older versions of Microsoft OWA) or volatile data such as parameters. Because FortiWeb is unlikely to receive identical subsequent requests for them, dynamic URLs can rapidly consume cache without improving performance.	No default.
`cookie-name "<cookie-name_str>"`	Specify the name of the cookie, such as `sessionid`, as it appears in the `Cookie:` HTTP header. Maximum length is 127 characters. **Tip:** Content that is unique to a user, such as personalized pages that appear after a person has logged in, usually should not be cached. If the web application's authentication is cookie-based, configure this setting with the name of the authentication cookie. Otherwise, if it is parameter-based, configure the exception with a URL pattern that matches the authentication ID parameter.	No default.

waf web-cache-policy

Use this command to configure FortiWeb to cache responses from your servers.

Use `web-cache-policy` to cache only a few URLs. To cache all URLs except for a few, see `config waf web-cache-exception` (page 524).

To apply this policy, include it in an inline protection profile. For details, see `config waf web-protection-profile inline-protection` (page 528).

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf web-cache-policy
   edit "<web-cache-policy_rule_name>"
      set cache-buffer-size <cache-size_int>
      set max-cached-page size <page-size_int>
      set default-cache-timeout <cache-timeout_int>
      set exception "<web-cache-exception_name>"
      config url-match-list
         edit <entry_index>
            set host-status {enable | disable}
            set host "<host_str>"
            set url-type {plain | regular}
            set url-pattern "<url-pattern_str>"
      end
   next
end
```

Variable	Description	Default
`"<web-cache-policy_rule_name>"`	Enter the name of a new or existing rule. The maximum length is 63 characters. To display the list of existing policies, enter: `edit ?`	No default.
`cache-buffer-size <cache-size_int>`	Specify the maximum amount of RAM to allocate to caching content, in MB (megabytes). You cannot store cached content on FortiWeb's hard disk. The FortiWeb model determines the valid range of values: • FortiWeb 400C, FortiWeb-VM (2-4 GB RAM): 1–100 MB • FortiWeb 1000C, FortiWeb-VM (4-8 GB RAM): 1–200 MB • FortiWeb 3000C, FortiWeb 3000C/CFsx, FortiWeb-VM (8–16 GB RAM): 1–400 MB • FortiWeb 4000C: 1–600 MB	`100`

Variable	Description	Default
	• FortiWeb 1000D: 1–800 MB • FortiWeb 1000E: 1–800 MB • FortiWeb-VM (16+ GB RAM): 1–1,024 MB • FortiWeb 3000D/DFsx: 1–1,200 MB • FortiWeb 4000D: 1–2,048 MB If administrative domains (ADOMs) are enabled, the maximums apply to the total RAM allotted to all ADOMs. For example, a FortiWeb 1000D has two ADOMs. If the `cache-buffer-size` value for the first ADOM is `600`, the valid range for `cache-buffer-size` for the second ADOM is 1–200. **Tip:** For improved performance, adjust this setting until it is as small as possible yet FortiWeb can still fit most graphics and server processing-intensive pages into its cache. This allows FortiWeb to allocate more RAM to other features that also affect throughput, such as scanning for attacks.	
`max-cached-page size <page-size_int>`	Specify the maximum size of each URL that FortiWeb caches, in kilobytes (KB). FortiWeb does not cache objects such as high-resolution images, movies, or music that are larger than this value. The valid range is 1–10,240. **Tip:** For improved performance, adjust this setting until FortiWeb can fit most graphics and server processing-intensive pages into its cache.	`2048`
`default-cache-timeout <cache-timeout_int>`	Specify the time to live for each entry in the cache. FortiWeb removes expired entries. Valid range is 0–7,200. When it receives a subsequent request for the URL, FortiWeb forwards the request to the server and refreshes the cached response. Any additional requests receive the new cached response until the URL's cache timeout expires.	`1440`
`exception "<web-cache-exception_name>"`	Specify the name of a list of exceptions. For details, see "waf web-cache-exception" on page 524.	No default.
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,999,999,999,999,999,999.	No default.
`host-status {enable | disable}`	Specify `enable` to require that the `Host:` field of the HTTP	`disable`

Variable	Description	Default
	request match a protected host names entry in order to match the policy. Also specify a value for `host "<host_str>"` (page 528).	
`host "<host_str>"`	Specify which protected host names entry (either a web host name or IP address) that the `Host:` field of the HTTP request must be in to match the policy. This option is available only if the value of `host-status {enable | disable}` (page 527) is `enabled`.	No default.
`url-type {plain | regular}`	Specify the type of value that is used for `url-pattern "<url-pattern_str>"` (page 528): `plain`—A literal URL. `regular`—A regular expression designed to match multiple URLs.	`plain`
`url-pattern "<url-pattern_str>"`	If the value of `url-type {plain | regular}` (page 528) is `plain`, specify the literal URL, such as `/index.php`, that the HTTP request must contain in order to match the rule. The URL must begin with a slash (/). If the value of `url-type` is `regular`, specify a regular expression, such as `^/*.php`, that matches all and only the URLs that the rule applies to. The pattern does not require a slash (/); however, it must match URLs that begin with a slash, such as `/index.cfm`. Do not include the domain name, such as `www.example.com`, which is specified by `host "<host_str>"` (page 528).	No default.

waf web-protection-profile inline-protection

Use this command to configure inline protection profiles.

Inline protection profiles are a set of attack protection settings. The FortiWeb appliance applies the profile when a connection matches a server policy that includes the protection profile. You can use inline protection profiles in server policies for any mode except Offline Protection.

To apply protection profiles, select them within a server policy. For details, see "server-policy policy" on page 136.

Before configuring an inline protection profile, first configure any of the following that you want to include in the profile:

- Parameter validation rule (see "waf parameter-validation-rule" on page 471)
- Start pages (see "waf start-pages" on page 498)
- Caching of back-end server responses (see "waf web-cache-policy" on page 526)
- URL access policy (see "waf url-access url-access-policy" on page 502
- Hidden field rule group (see "waf hidden-fields-protection" on page 409)
- Parameter restriction constraint (see "waf http-protocol-parameter-restriction" on page 429)
- Authentication policy and/or site publisher (see "waf http-authen http-authen-policy" on page 414 and "waf site-publish-helper policy" on page 483)
- Brute force login attack sensor (see "waf brute-force-login" on page 356)
- Allowed method exception (see "waf allow-method-exceptions" on page 340)
- List of manually trusted and black-listed IPs, FortiGuard IP reputation category-based blacklisted IPs, and/or a geographically-based IP blacklist (see "waf ip-intelligence" on page 441, "server-policy custom-application application-policy" on page 1, and "waf geo-block-list" on page 406)
- Page order rule (see "waf page-access-rule" on page 468)
- Attack signatures (see "waf signature" on page 472)
- File security policy (see "server-policy custom-application application-policy" on page 1)
- URL rewriting policy (see "waf url-rewrite url-rewrite-policy" on page 508)
- XML protection policy ("waf xml-validation" on page 556)
- DoS protection policy (see "waf application-layer-dos-prevention" on page 344)
- Compression rules (see "waf file-compress-rule" on page 393)
- Policy that protects vulnerable block cipher implementations for web applications that selectively encrypt inputs without using HTTPS ("waf padding-oracle" on page 464)
- FortiGate that provides a list of quarantined source IPs ("system fortigate-integration" on page 251)
- Cross-site request forgery (CSRF) protection rule (see "waf csrf-protection" on page 363)
- Cookie security policy (see "waf cookie-security" on page 359)
- User tracking policy (see "waf user-tracking policy" on page 517)

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf web-protection-profile inline-protection
   edit "<inline-protection-profile_name>"
      set http-session-management {enable | disable}
      set http-session-timeout <seconds_int>
      set x-forwarded-for-rule "<x-forwarded-for_name>"
      set signature-rule {"High Level Security" | "Medium Level Security" | "Alert
          Only" | <signature-set_name>}
      set amf3-protocol-detection {enable | disable}

        set websocket-security-policy "<websocket-security-policy_name>"

    next
end
```

Variable	Description	Default
"<inline-protection-profile_name>"	Enter the name of the inline protection profile. The maximum length is 63 characters. To display the list of existing profiles, enter:	No default.

Variable	Description	Default
	`edit ?`	
`http-session-management {enable | disable}`	Enable to add an implementation of HTTP sessions, and track their states, using a cookie such as `cookiesession1`. Also configure `http-session-timeout <seconds_int>` (page 531). Although HTTP has no inherent support for sessions, a notion of individual HTTP client sessions, rather than simply the source IP address and/or timestamp, is required by some features. For example, you might want to require that a client's first HTTP request always be a login page: the rest of the web pages should be inaccessible if they have not authenticated. Out-of-order requests could represent an attempt to bypass the web application's native authentication mechanism. How can FortiWeb know if a request is the client's first HTTP request? If FortiWeb were to treat each request independently, without knowledge of anything previous, it could not, by definition, enforce page order. Therefore FortiWeb must keep some record of the first request from that client (the session initiation). It also must record their previous HTTP request(s), until a span of time (the session timeout) has elapsed during which there were no more subsequent requests, after which it would require that the session be initiated again. The session management feature provides such FortiWeb session support. This feature requires that the client support cookies. **Note:** You **must** enable this option: • To enforce the start page rule, page access rule, and hidden fields rule, if any of those are selected. • If you want to include this profile's traffic in the traffic log, in addition to enabling traffic logs in general. For details, see "log attack-log" on page 72.	`disable`
`http-session-timeout <seconds_int>`	Enter the HTTP session timeout in seconds. The valid range is 20–3,600. This setting is available only if `http-session-management {enable | disable}` (page 531) is enabled.	`1200`

Variable	Description	Default
`x-forwarded-for-rule "<x-forwarded-for_name>"`	Specify the name of a rule that configures FortiWeb's use of X-Forwarded-For: and X-Real-IP. The maximum length is 63 characters. For details, see "waf x-forwarded-for" on page 551. To display the list of existing rules, enter: `set x-forwarded-for-rule ?`	No default.
`signature-rule {"High Level Security" | "Medium Level Security" | "Alert Only" | <signature-set_name>}`	Specify a signature policy to include in the profile. The maximum length is 63 characters. For details, see "waf signature" on page 472. To display the list of existing rules, enter: `set server-protection-rule ?` The type of attack that FortiWeb detects determines the attack log messages for this feature. For a list, see "waf signature" on page 472.	No default.
`amf3-protocol-detection {enable | disable}`	Enable to scan requests that use action message format 3.0 (AMF3) for these attacks if you have enabled those in the signature set specified by `signature-rule {"High Level Security" | "Medium Level Security" | "Alert Only" | <signature-set_name>}` (page 532): • Cross-site scripting (XSS) attacks • SQL injection attacks • Common exploits AMF3 is a binary format that Adobe Flash clients can use to send input to server-side software. **Caution:** To scan for attacks or enforce input rules on AMF3, you **must** enable this option. Failure to enable the option will make the FortiWeb appliance unable to scan AMF3 requests for attacks.	`disable`
`xml-protocol-detection {enable | disable}`	Enable to scan for matches with attack and data leak signatures in Web 2.0 (XML AJAX) and other XML submitted by clients in the bodies of HTTP `POST` requests.	`disable`
`malformed-xml-check {enable | disable}`	Enable to validate that XML elements and attributes in the request's body conforms to the W3C XML 1.1 and/or XML 2.0 standards (http://www.w3.org/TR/xml-c14n2). Malformed XML, such as without the final > or with multiple >> in the closing tag, is often an attempt to exploit an unhandled error condition in a web application's XHTML or	`disable`

Variable	Description	Default
	XML parser. This feature is applicable only when `xml-protocol-detection {enable | disable}` (page 532) is `enable`. Attack log messages contain `Illegal XML Format` when this feature detects malformed XML.	
`malformed-xml-check-action {alert | alert_deny | block-period}`	Specify the action that FortiWeb takes when it detects a request that contains malformed XML: • `alert`—Accept the request and generate an alert email, a log message, or both. • `alert_deny`—Block the request and generate an alert email, a log message, or both. • `block-period`—Block the XML traffic for a number of seconds. Also configure `malformed-xml-block-period <block-period_int>` (page 533).	alert
`malformed-xml-block-period <block-period_int>`	Enter the length of time (in seconds) that FortiWeb blocks XML traffic that contains malformed XML, in seconds. The valid range is from 1–3,600.	`60`
`malformed-xml-check-severity {High | Low | Medium}`	Select the severity level to use in logs and reports generated when illegal XML formats are detected.	High
`malformed-xml-check-trigger "<trigger-policy_name>"`	Enter the name of the trigger to apply when illegal XML formats are detected. The maximum length is 63 characters. For details, see "log trigger-policy" on page 105. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
`json-protocol-detection {enable | disable}`	Enter `enable` to scan for matches with attack and data leak signatures in JSON data submitted by clients in HTTP requests with `Content-Type:` values `application/json` or `text/json`.	`disable`
`malformed-json-check {enable | disable}`	Enter `enable` to scan for illegal formatting in JSON data.	`disable`
`malformed-json-check-action {alert | alert_deny | block-period}`	Specify the action that FortiWeb takes when it detects a request that contains malformed JSON content: • `alert`—Accept the request and generate an alert email, a log message, or both. • `alert_deny`—Block the request and generate an alert email, a log message, or both.	No default.

Variable	Description	Default
	• `block-period`—Block the JSON traffic for a number of seconds. Also configure `malformed-json-block-period <block-period_int>` (page 534).	
`malformed-json-block-period <block-period_int>`	Enter the length of time (in seconds) that FortiWeb blocks traffic that contains malformed JSON content, in seconds. The valid range is 1–3,600.	`60`
`malformed-json-check-severity {High | Medium | Low}`	Select the severity level to use in logs and reports that FortiWeb generates when it detects malformed JSON content.	`High`
`malformed-json-check-trigger "<trigger-policy_name>"`	Enter the name of the trigger to apply when FortiWeb detects malformed JSON content. The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
`custom-access-policy "<combo-access_name>"`	Enter the name of a custom access policy. The maximum length is 63 characters. For details, see "waf custom-access policy" on page 367. To display the list of existing policies, enter: `set custom-access-policy ?`	No default.
`padding-oracle "<rule_name>"`	Enter the name of a padding oracle protection rule. The maximum length is 63 characters. For details, see "waf padding-oracle" on page 464. To display the list of existing rules, enter: `set padding-oracle ?`	No default.
`csrf-protection "<rule_name>"`	Select the name of cross-site request forgery protection rule, if any, to apply to matching requests. For details, see "waf csrf-protection" on page 363. Available only when `http-session-management {enable | disable}` (page 531) is `enabled`.	No default.
`cookie-security-policy "<cookie-security_name>"`	Enter the name of a cookie security policy. For details, see "waf cookie-security" on page 359. To display the list of existing policies, enter: `set cookie-security-policy ?`	

Variable	Description	Default
`parameter-validation-rule "<rule_name>"`	Enter the name of a parameter validation rule. The maximum length is 63 characters. For details, see "waf parameter-validation-rule" on page 471. To display the list of existing rules, enter: `set parameter-validation-rule ?`	No default.
`hidden-fields-protection "<group_name>"`	Enter the name of a hidden field rule group that you want to apply, if any. The maximum length is 63 characters. For details, see "waf hidden-fields-protection" on page 409. To display the list of existing groups, enter: `set hidden-fields-protection ?`	No default.
`file-upload-policy "<policy_name>"`	Enter the name of a file upload security policy to use, if any. The maximum length is 63 characters. For details, see "server-policy custom-application application-policy" on page 1. To display the list of existing policies, enter: `set file-upload-policy ?`	No default.
`http-protocol-parameter-restriction "<constraint_name>"`	Enter the name of an HTTP protocol constraint that you want to apply, if any. The maximum length is 63 characters. For details, see "waf http-protocol-parameter-restriction" on page 429. To display the list of existing profiles, enter: `set http-protocol-parameter-restriction ?`	No default.
`brute-force-login "<sensor_name>"`	Enter the name of a brute force login attack sensor. The maximum length is 63 characters. For details, see "waf brute-force-login" on page 356. To display the list of existing sensors, enter: `set brute-force-login ?`	No default.
`url-access-policy "<policy_name>"`	Enter the name of a URL access policy. The maximum length is 63 characters. For details, see "waf url-access url-access-policy" on page 502. To display the list of existing policies, enter: `set url-access-policy ?`	No default.
`page-access-rule "<rule_name>"`	Enter the name of a page order rule. The maximum length is 63 characters. For details, see "waf page-access-rule" on	No default.

Variable	Description	Default
	page 468. To display the list of existing rule, enter: `set page-access-rule ?`	
`start-pages "<rule_name>"`	Enter the name of a start page rule. The maximum length is 63 characters. For details, see "waf start-pages" on page 498. To display the list of existing rules, enter: `set start-pages ?` This setting is available only if `http-session-management {enable | disable}` (page 531) is enabled.	No default.
`allow-method-policy "<policy_name>"`	Enter the name of an allowed method policy. The maximum length is 63 characters. For details, see "server-policy custom-application application-policy" on page 1. To display the list of existing policies, enter: `set allow-method-policy ?`	No default.
`ip-list-policy "<policy_name>"`	Enter the name of a trusted IP or blacklisted IP policy. The maximum length is 63 characters. For details, see "server-policy custom-application application-policy" on page 1. To display the list of existing policies, enter: `set ip-list-policy ?`	No default.
`geo-block-list-policy "<policy_name>"`	Enter the name of a geographically-based client IP black list that you want to apply, if any. The maximum length is 63 characters. For details, see "waf geo-block-list" on page 406. To display the list of existing groups, enter: `set geo-block-list-policy ?`	No default.
`application-layer-dos-prevention "<policy_name>"`	Enter the name of an existing DoS protection policy to use with this profile, if any. The maximum length is 63 characters. For details, see "waf application-layer-dos-prevention" on page 344. To display the list of existing profiles, enter: `set application-layer-dos-prevention ?`	No default.
`ip-intelligence {enable | disable}`	Enable to apply intelligence about the reputation of the client's source IP. Blocking and logging behavior is	`disable`

Variable	Description	Default
	configured in "waf ip-intelligence" on page 441.	
`fortigate-quarantined-ips {enable | disable}`	Enable to detect source IP addresses that a FortiGate unit is currently preventing from interacting with the network and protected systems. To configure communication between the FortiGate and FortiWeb, see "system fortigate-integration" on page 251.	`disable`
`quarantined-ip-action {alert | alert_deny}`	Specify the action that FortiWeb takes if it detects a quarantined IP address: • `alert`—Accept the request and generate an alert email, log message, or both. • `alert_deny`—Block the request and generate an alert, log message, or both.	`alert`
`quarantined-ip-severity {High | Medium | Low}`	Specify the severity that FortiWeb assigns to quarantined IP log messages.	`High`
`quarantined-ip-trigger "<trigger-policy_name>"`	Enter the name of the trigger to apply when FortiWeb detects a quarantined IP. For deails, see "log trigger-policy" on page 105. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
`known-search-engine {enable | disable}`	Enable to allow or block predefined search engines, robots, spiders, and web crawlers according to your settings in the global list. Enable to exempt popular search engines' robots, spiders, and web crawlers from DoS sensors, brute force login sensors, HTTP protocol constraints, and combination rate & access control (called "advanced protection" and "custom policies" in the web UI). This option improves access for search engines. Rapid access rates, unusual HTTP usage, and other characteristics that may be suspicious for web browsers are often normal with search engines. If you block them, your websites' rankings and visibility may be affected. By default, this option allows all popular predefined search engines. Known search engine indexer source IPs are updated via FortiGuard Security Service. To specify which search engines will be exempt, enable or disable each search engine in "server-policy pattern custom-global-white-list-group" on page 126.	`disable`

Variable	Description	Default
	Note: X-header-derived client source IPs do **not** support this feature in this release. If FortiWeb is deployed behind a load balancer or other web proxy that applies source NAT, this feature will not work. For details, see "waf x-forwarded-for" on page 551.	
`url-rewrite-policy "<group_name>"`	Enter the name of a URL rewriting rule set, if any, that will be applied to matching HTTP requests. The maximum length is 63 characters. To display the list of existing policies, enter: `set url-rewrite-policy ?` For details, see "waf url-access url-access-policy" on page 502.	No default.
`http-authen-policy "<policy_name>"`	Enter the name of an HTTP authentication policy, if any, that will be applied to matching HTTP requests. The maximum length is 63 characters. For details, see "waf http-authen http-authen-policy" on page 414. To display the list of existing profiles, enter: `set http-authen-policy ?` If the HTTP client fails to authenticate, it will receive an HTTP 403 (Access Forbidden) error message.	No default.
`http-header-security "<policy_name>"`	Enter the name of an HTTP Header Security Policy, if any. For details, see "waf http-header-security" on page 426. To display the list of existing policies, enter: `set http-header-security ?`	No default.
`site-publisher-helper "<policy_name>"`	Enter the name of a site publishing policy, if any, that will be applied to matching HTTP requests. The maximum length is 63 characters. For details, see "waf site-publish-helper policy" on page 483. To display the list of existing profiles, enter: `set site-publisher-policy ?` If the HTTP client fails to authenticate, it will receive an HTTP 403 (Access Forbidden) error message.	No default.
`file-compress-rule "<rule_name>"`	Enter the name of an existing file compression rule to use with this profile, if any. The maximum length is 63 characters. For details, see "waf file-compress-rule" on page 393.	No default.

Variable	Description	Default
	To display the list of existing rules, enter: `set file-compress-rule ?`	
`web-cache-policy "<web-cache-policy_name>"`	Enter the name of content caching policy. The maximum length is 63 characters. For details, see "waf web-cache-policy" on page 526. To display the list of existing policies, enter: `set web-cache-policy ?`	No default.
`user-tracking-policy "<user-tracking-policy_name>"`	Enter the name of a user tracking policy. The maximum length is 63 characters. For details, see "waf user-tracking policy" on page 517. To display the list of existing policies, enter: `set user-tracking-policy ?`	No default.
`redirect-url "<redirect_fqdn>"`	Enter a URL, including the FQDN/IP and path, if any, to which an HTTP client will be redirected if their HTTP request violates any of the rules in this profile. For example, you could enter `www.example.com/products/`. If you do **not** enter a URL, depending on the type of violation and the configuration, the FortiWeb appliance will log the violation, may attempt to remove the offending parts, and could either reset the connection or return an HTTP 403 (Access Forbidden) or 404 (File Not Found) error message. The maximum length is 255 characters.	No default.
`rdt-reason {enable | disable}`	Enable to include the reason for URL redirection as a parameter in the URL, such as `reason=DETECT_PARAM_RULE_FAILED`, when traffic has been redirected using `redirect-url "<redirect_fqdn>"` (page 539). The FortiWeb appliance also adds `fortiwaf=1` to the URL to detect and cancel a redirect loop when the redirect action recursively triggers an attack event. **Caution**: If you specify a redirect URL that is protected by the FortiWeb appliance, you should enable this option to prevent infinite redirect loops.	No default.
`data-analysis {enable | disable}`	Enable this to collect data for servers covered by this profile. To view the statistics for collected data, in the web UI, go to **Log&Report > Monitor > Data Analytics**.	`disable`

Variable	Description	Default
`comment "<comment_str>"`	Enter a description or other comment. If the comment contains more than one word or contains an apostrophe, surround the comment in double quotes ("). The maximum length is 199 characters.	No default.
`device-tracking {enable | disable}`	Enter to enable Device Tracking. When this feature is enabled, if a device triggers a security violation, FortiWeb generates a unique device ID according to a set of the device's characteristics, including the time zone, source IP, operating system, browser, language, CPU, color depth, and screen size. For details, see "system device-tracking" on page 236.	`disable`
`device-reputation-security-policy "<drs_policy_name>"`	Enter the name of a device reputation security policy, if any. The maximum length is 63 characters. For details, see "system device-tracking" on page 236. To display the list of existing policies, enter: `set device-reputation-security-policy ?`	No default.
`xml-validation-policy "<xml_policy_name>"`	Enter the name of an XML protection policy, if any. The maximum length is 63 characters. For details, see "waf xml-validation" on page 556. To display the list of existing policies, enter: `set xml-validation-policy ?`	No default.
`profile-id "<profile-id_str>"`	Enter the inline profile ID.	No default.
`mitb-protection "<mitb-protection_name>"`	Enter the MiTB protection policy name.	No default.
`openapi-validation-policy "<openapi-validation-policy_name>"`	Enter the openapi validation policy name.	No default.
`websocket-security-policy "<websocket-security-policy_name>"`	Enter the websocket security policy name.	No default.

waf web-protection-profile offline-protection

Use this command to configure Offline Protection profiles.

Detection profiles are useful when you want to preview the effects of some web protection features without affecting traffic, or without affecting your network topology.

Unlike protection profiles, a detection profile is designed for use in Offline Protection mode. Detection profiles cannot be guaranteed to block attacks. They attempt to reset the connection, but due to variable speeds of different routing paths, the reset request may arrive after the attack has been completed. Their primary purpose is to detect attacks, especially for use in conjunction with auto-learning profiles. In fact, if used in conjunction with auto-learning profiles, you **should** configure the detection profile to log only and not block attacks in order to gather complete session statistics for the auto-learning feature. As a result, detection profiles can only be selected in policies whose `deployment-mode` is `offline-detection`, and those policies will only be used by the FortiWeb appliance when its operation mode is `offline-detection`.

Unlike inline protection profiles, Offline Protection profiles do not support HTTP conversion, cookie poisoning detection, start page rules, and page access rules.

To apply detection profiles, select them within a server policy. For details, see "server-policy policy" on page 136.

Before configuring an Offline Protection profile, first configure any of the following that you want to include in the profile:

- File security policy (see "server-policy custom-application application-policy" on page 1)
- Server protection rule (see "waf signature" on page 472)
- List of manually trusted and black-listed IPs, FortiGuard IRIS category-based blacklisted IPs, and/or a geographically-based IP blacklist (see "waf ip-intelligence" on page 441, "server-policy custom-application application-policy" on page 1 and "waf geo-block-list" on page 406)

- Parameter validation rule (see "waf parameter-validation-rule" on page 471)
- URL access policy (see "waf url-access url-access-policy" on page 502
- Allowed method exception (see "waf allow-method-exceptions" on page 340)
- Hidden field rule group (see "waf hidden-fields-protection" on page 409)
- Parameter restriction constraint (see "waf http-protocol-parameter-restriction" on page 429)
- Brute force login attack sensor (see "waf brute-force-login" on page 356)
- Policy that protects vulnerable block cipher implementations for web applications that selectively encrypt inputs without using HTTPS ("waf padding-oracle" on page 464)
- User tracking policy (see "waf user-tracking policy" on page 517)

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf web-protection-profile offline-protection
   edit "<offline-protection-profile_name>"
      set http-session-management {enable | disable}
      set http-session-timeout <seconds_int>
      set x-forwarded-for-rule "<x-forwarded-for_name>"
      set http-session-keyword "<key_str>"
      set signature-rule {"High Level Security" | "Medium Level Security" | "Alert
          Only" | "<signature-set_name>"}
      set amf3-protocol-detection {enable | disable}
      set xml-protocol-detection {enable | disable}
      set malformed-xml-check {enable | disable}
      set malformed-xml-check-action {alert | alert_deny | block-period}
      set malformed-xml-block-period <block-period_int>
      set malformed-xml-check-severity {High | Low | Medium}
      set malformed-xml-check-trigger "<trigger-policy_name>"
      set json-protocol-detection {enable | disable}
      set malformed-json-check {enable | disable}
      set malformed-json-check-action {alert | alert_deny | block-period}
      set malformed-json-block-period <block-period_int>
      set malformed-json-check-severity {High | Medium | Low}
      set malformed-json-check-trigger "<trigger-policy_name>"
      set custom-access-policy "<combo-access_name>"
      set padding-oracle "<rule_name>"
      set parameter-validation-rule "<rule_name>"
      set hidden-fields-protection "<group_name>"
      set file-upload-policy "<policy_name>"
      set http-protocol-parameter-restriction "<constraint_name>"
      set url-access-policy "<policy_name>"
      set allow-method-policy "<policy_name>"
      set brute-force-login "<sensor_name>"
      set ip-list-policy "<policy_name>"
      set geo-block-list-policy "<policy_name>"
      set ip-intelligence {enable | disable}
      set known-search-engine {enable | disable}
      set csrf-protection "<rule_name>"
      set user-tracking-policy "<user-tracking-policy_name>"
      set data-analysis {enable | disable}
      set comment "<comment_str>"
      set openapi-validation-policy "<openapi-validation-policy_name>"
```

```
    next
  end
```

Variable	Description	Default
"<offline-protection-profile_name>"	Enter the name of the Offline Protection profile. The maximum length is 63 characters. To display the list of existing profiles, enter: `edit ?`	No default.
http-session-management {enable | disable}	Enable to track the states of HTTP sessions. Also configure `http-session-timeout <seconds_int>` (page 543). Although HTTP has no inherent support for sessions, a notion of individual HTTP client sessions, rather than simply the source IP address and/or timestamp, is required by some features. For example, you might want to require that a client's first HTTP request always be a login page: the rest of the web pages should be inaccessible if they have not authenticated. Out-of-order requests could represent an attempt to bypass the web application's native authentication mechanism. How can FortiWeb know if a request is the client's first HTTP request? If FortiWeb were to treat each request independently, without knowledge of anything previous, it could not, by definition, enforce page order. Therefore FortiWeb must keep some record of the first request from that client (the session initiation). It also must record their previous HTTP request(s), until a span of time (the session timeout) has elapsed during which there were no more subsequent requests, after which it would require that the session be initiated again. The session management feature provides such FortiWeb session support. **Note:** This feature requires that the client support cookies. **Note:** You **must** enable this option if you want to include this profile's traffic in the traffic log, in addition to enabling traffic logs in general. For details, see "log attack-log" on page 72.	disable
http-session-timeout <seconds_int>	Enter the HTTP session timeout in seconds. The valid range is 20–3,600. This setting is available only if `http-session-management {enable | disable}` (page 543) is enabled.	1200

Variable	Description	Default
`x-forwarded-for-rule "<x-forwarded-for_name>"`	Specify the name of a rule that configures FortiWeb's use of X-Forwarded-For: and X-Real-IP. For details, see "waf x-forwarded-for" on page 551. To display a list of existing rules, enter: `set forwarded-for-rule ?`	No default.
`http-session-keyword "<key_str>"`	If you want to use an HTTP header other than `Session-Id:` to track separate HTTP sessions, enter the key portion of the HTTP header that you want to use, such as `Session-Num`. The maximum length is 63 characters.	No default.
`signature-rule {"High Level Security" | "Medium Level Security" | "Alert Only" | "<signature-set_ name>"}`	Specify a signature policy to include in the profile. The maximum length is 63 characters. For details, see "waf signature" on page 472. To display the list of existing rules, enter: `set server-protection-rule ?` The type of attack that FortiWeb detects determines the attack log messages for this feature. For a list, see "waf signature" on page 472.	No default.
`amf3-protocol-detection {enable | disable}`	Enable to scan requests that use the action message format 3.0 (AMF3) for these attacks if you have enabled those in the set of signatures specified by `signature-rule {"High Level Security" | "Medium Level Security" | "Alert Only" | "<signature-set_ name>"}` (page 544): • Cross-site scripting (XSS) attacks • SQL injection attacks • Common exploits AMF3 is a binary format that can be used by Adobe Flash clients to send input to server-side software. **Caution:** To scan for attacks or enforce input rules on AMF3, you **must** enable this option. Failure to enable the option makes the FortiWeb appliance unable to scan AMF3 requests for attacks.	`disable`
`xml-protocol-detection {enable | disable}`	Enable to scan for matches with attack and data leak signatures in Web 2.0 (XML AJAX) and other XML submitted by clients in the bodies of HTTP `POST` requests.	`disable`

Variable	Description	Default
`malformed-xml-check {enable | disable}`	Enable to validate that XML elements and attributes in the request's body conforms to the W3C XML 1.1 (http://www.w3.org/TR/xml11) and/or XML 2.0 (http://www.w3.org/TR/xml-c14n2) standards. Malformed XML, such as without the final > or with multiple >> in the closing tag, is often an attempt to exploit an unhandled error condition in a web application's XHTML or XML parser. Attack log messages contain `Illegal XML Format` when this feature detects malformed XML. This feature is applicable only when `xml-protocol-detection {enable | disable}` (page 544) is `enable`.	`disable`
`malformed-xml-check-action {alert | alert_deny | block-period}`	Specify the action that FortiWeb takes when it detects a request that contains malformed XML: • `alert`—Accept the request and generate an alert email, a log message, or both. • `alert_deny`—Block the request and generate an alert email, a log message, or both. • `block-period`—Block the XML traffic for a number of seconds. Also configure `malformed-xml-block-period <block-period_int>` (page 533).	alert
`malformed-xml-block-period <block-period_int>`	Enter the length of time (in seconds) that FortiWeb blocks XML traffic that contains malformed XML, in seconds. The valid range is 1–3,600.	60
`malformed-xml-check-severity {High | Low | Medium}`	Select the severity level to use in logs and reports generated when illegal XML formats are detected.	High
`malformed-xml-check-trigger "<trigger-policy_name>"`	Enter the name of the trigger to apply when illegal XML formats are detected. The maximum length is 63 characters. For details, see "log trigger-policy" on page 105. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
`json-protocol-detection {enable | disable}`	Enable to scan for matches with attack and data leak signatures in JSON data submitted by clients in HTTP requests with `Content-Type:` values `application/json` or `text/json`.	`disable`
`malformed-json-check {enable | disable}`	Enter `enable` to scan for illegal formatting in JSON data.	`disable`

Variable	Description	Default
`malformed-json-check-action {alert | alert_deny | block-period}`	Specify the action that FortiWeb takes when it detects a request that contains malformed JSON content: • `alert`—Accept the request and generate an alert email, a log message, or both. • `alert_deny`—Block the request and generate an alert email, a log message, or both. • `block-period`—Block the JSON traffic for a number of seconds. Also configure `malformed-json-block-period <block-period_int>` (page 546).	No default.
`malformed-json-block-period <block-period_int>`	Enter the length of time (in seconds) that FortiWeb blocks traffic that contains malformed JSON content. The valid range is 1–3,600.	`60`
`malformed-json-check-severity {High | Medium | Low}`	Select the severity level to use in logs and reports that FortiWeb generates when it detects malformed JSON content.	`High`
`malformed-json-check-trigger "<trigger-policy_name>"`	Enter the name of the trigger to apply when FortiWeb detects malformed JSON content. The maximum length is 63 characters. To display the list of existing trigger policies, enter: `set trigger ?`	No default.
`custom-access-policy "<combo-access_name>"`	Enter the name of a custom access policy. The maximum length is 63 characters. For details, see "waf custom-access policy" on page 367. To display the list of existing policies, enter: `set custom-access-policy ?`	No default.
`padding-oracle "<rule_name>"`	Enter the name of a padding oracle protection rule. The maximum length is 63 characters. For details, see "waf padding-oracle" on page 464. To display the list of existing rules, enter: `set padding-oracle ?`	No default.
`parameter-validation-rule "<rule_name>"`	Enter the name of a parameter validation rule. The maximum length is 63 characters. For details, see "waf parameter-validation-rule" on page 471. To display the list of existing rules, enter: `set parameter-validation-rule ?`	No default.

Variable	Description	Default
`hidden-fields-protection "<group_name>"`	Enter the name of a hidden field rule group that you want to apply, if any. The maximum length is 63 characters. For details, see "waf hidden-fields-protection" on page 409. To display the list of existing groups, enter: `set hidden-fields-protection ?`	No default.
`file-upload-policy "<policy_name>"`	Enter the name of a file security policy. The maximum length is 63 characters. For details, see "server-policy custom-application application-policy" on page 1. To display the list of existing policies, enter: `set file-upload-policy ?`	No default.
`http-protocol-parameter-restriction "<constraint_name>"`	Enter the name of an HTTP protocol constraint that you want to apply, if any. The maximum length is 63 characters. For details, see "waf http-protocol-parameter-restriction" on page 429. To display the list of existing constraints, enter: `set http-protocol-parameter-restriction ?`	No default.
`url-access-policy "<policy_name>"`	Enter the name of a URL access policy. The maximum length is 63 characters. For details, see "waf url-access url-access-policy" on page 502. To display the list of existing policies, enter: `set url-access-policy ?`	No default.
`allow-method-policy "<policy_name>"`	Enter the name of an allowed method policy. The maximum length is 63 characters. For details, see "server-policy custom-application application-policy" on page 1. To display the list of existing policies, enter: `set allow-method-policy ?`	No default.
`brute-force-login "<sensor_name>"`	Enter the name of a brute force login attack sensor. The maximum length is 63 characters. For details, see "waf brute-force-login" on page 356. To display the list of existing sensors, enter: `edit ?`	No default.
`ip-list-policy "<policy_name>"`	Enter the name of a trusted IP or blacklisted IP policy. The maximum length is 63 characters. For details, see "server-policy custom-application application-policy" on page 1.	No default.

Variable	Description	Default
	To display the list of existing policies, enter: `set ip-list-policy ?`	
`geo-block-list-policy "<policy_name>"`	Enter the name of a geographically-based client IP black list that you want to apply, if any. The maximum length is 63 characters. For details, see "waf geo-block-list" on page 406. To display the list of existing policies, enter: `set geo-block-list-policy ?`	No default.
`ip-intelligence {enable | disable}`	Enable to apply intelligence about the reputation of the client's source IP. Blocking and logging behavior is configured in "waf ip-intelligence" on page 441.	`disable`
`known-search-engine {enable | disable}`	Enable to allow or block predefined search engines, robots, spiders, and web crawlers according to your settings in the global list.	`disable`
`csrf-protection "<rule_name>"`	Select the name of cross-site request forgery protection rule, if any, to apply to matching requests. See "waf csrf-protection" on page 363. To display the list of existing rules, enter: `set csrf-protection ?` Available only when `http-session-management {enable | disable}` (page 543) is `enabled`.	
`user-tracking-policy "<user-tracking-policy_name>"`	Enter the name of a user tracking policy. The maximum length is 63 characters. For details, see "waf user-tracking policy" on page 517. To display the list of existing policies, enter: `set user-tracking-policy ?`	No default.
`data-analysis {enable | disable}`	Enable this to collect data for servers covered by this profile. To view the statistics for collected data, in the web UI, go to **Log&Report > Monitor > Data Analytics**.	`disable`
`comment "<comment_str>"`	Enter a description or other comment. If the comment contains more than one word or contains an apostrophe, surround the comment in double quotes ("). The maximum length is 199 characters.	No default.
`openapi-validation-policy "<openapi-`	Enter the openapi validation policy name.	No default.

Variable	Description	Default
validation-policy_name>"

waf websocket-security rule

Use this command to configure WebSocket rule related settings.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf websocket-security rule
   edit websocket-security_rule_name
      set host-status {enable | disable}
      set host <host_str>
      set url-type {plain | regular}
      set url <url_str>
      set block-websocket-traffic {enable | disable}
      set action {alert | deny_no_log | alert_deny}
      set max-frame-size <max-frame-size_int>
      set max-message-size <max-message-size_int>
      set block-extensions {enable | disable}
      set enable-attack-signatures {enable | disable}
      set allow-plain-text {enable | disable}
      set allow-binary-text {enable | disable}
      config allowed-origin-list
         edit allowed-origin-list <allowed-origin-list_id>
            set origin <origin_str>
end
```

Variable	Description	Default
`websocket-security_rule_name`	Enter the WebSocket security rule name.	No default.
`host-status {enable | disable}`	Enable to compare the WebSocket security rule to the `Host:` field in the HTTP header.	No default.
`host <host_str>`	Select the IP address or fully qualified domain name (FQDN) of the protected host to which this rule applies. This option is available only if Host Status is enabled.	No default.
`url-type {plain | regular}`	Select whether the URL Pattern field will contain a literal URL (Simple String), or a regular expression designed to match multiple URLs (Regular Expression).	`Plain`
`url <url_str>`	The URL which hosts the web page containing the user input fields you want to protect.	No default.
`block-websocket-traffic {enable | disable}`	Enable to deny the WebSocket traffic, and FortiWeb will not check any WebSocket related traffic. This option is disabled by default.	`Disable`
`action {alert | deny_no_log | alert_deny}`	Select which action the FortiWeb appliance will take when it detects a violation. **Alert**—Accept the connection and generate an alert email and/or log message. **Alert & Deny**—Block the request (or reset the connection) and generate an alert and/or log message. **Deny (no log)**—Block the request (or reset the connection).	`Alert`
`max-frame-size <max-frame-size_int>`	Specifies the maximum acceptable frame header and body size in bytes. The valid range is 0–2147483647 bytes.	`64`
`max-message-size <max-message-size_int>`	Specifies the maximum acceptable message header and body size in bytes. The valid range is 0–2147483647 bytes.	`1024`
`block-extensions {enable | disable}`	Enable to not check the extension header in WebSocket handshake packet. By default, this option is disabled.	`Disable`
`enable-attack-signatures {enable | disable}`	Enable to detect attack in WebSocket message body. But if WebSocket traffic has extension header and allow extension header in WebSocket security rule, FortiWeb can not detect attack signatures. When attack signature is detected, the actions FortiWeb will take follow those of related signatures.	`Disable`
`allow-plain-text {enable | disable}`	Enable to allow detecting the plain text.	`Enable`
`allow-binary-text {enable | disable}`	Enable to allow detecting the binary text.	`Enable`

Variable	Description	Default
`allowed-origin-list <allowed-origin-list_id>`	Enter the origin list ID in WebSocket handshake packet.	No default.
`origin <origin_str>`

waf websocket-security policy

Use this command to create WebSocket policy.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf websocket-security policy
   edit "<"<policy_name>"
      config rule-list
         edit rule-list_id
            set rule "<rule_name>"

end
```

Variable	Description	Default
`"<policy_name>"`	Enter the WebSocket Security policy name.	No default.
`rule-list_id`	Enter the sequence number of the rule in the rule list.	
`rule "<rule_name>"`	Select the created WebSocket security rule name.	No default.

- waf websocket-security rule

waf x-forwarded-for

Use this command to configure FortiWeb's use of `X-Forwarded-For:` and `X-Real-IP:`.

For behavior of this feature and requirements, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf x-forwarded-for
   edit "<x-forwarded-for_name>"
      set block-based-on-original-ip {enable | disable}
      set ip-location {left | right}
      set original-ip-header "<http-header-key_str>"
      set tracing-original-ip {enable | disable}
      set x-forwarded-proto {enable | disable}
      set x-forwarded-for-support {enable | disable}
      set x-real-ip {enable | disable}
      config ip-list
         edit <entry_index>
            set ip "<load-balancer_ip>"
         next
      end
   next
end
```

Variable	Description	Default
`"<x-forwarded-for_name>"`	Enter the name of the new or existing group. The maximum length is 63 characters. To display the list of existing groups, enter: `edit ?`	No default.
`block-based-on-original-ip {enable | disable}`	Enable to be able to block requests that violate your policies by using the original client's IP derived from this HTTP X-header. When disabled, only attack logs and reports will use the original client's IP.	`disable`
`ip-location {left | right}`	Select whether to extract the original client's IP from either the left or right end of the HTTP X-header line. Most proxies put the request's origin at the left end, which is the default setting. Some proxies, however, place it on the right end.	`left`
`original-ip-header "<http-header-key_str>"`	Enter the key of the X-header, such as `X-Forwarded-For` `X-Real-IP`, **without** the colon (:), that contains the original source IP address of the client. Also configure `tracing-original-ip {enable | disable}` (page 553) and, for security reasons, `ip "<load-balancer_ip>"` (page 554).	No default.

Variable	Description	Default
	Maximum length is 255 characters.	
`tracing-original-ip {enable | disable}`	If FortiWeb is deployed behind a device that applies NAT, enable this option to derive the original client's source IP address from an HTTP X-header, **instead of** the `SRC` field in the IP layer. Also configure `original-ip-header "<http-header-key_str>"` (page 552) and, for security reasons, `ip "<load-balancer_ip>"` (page 554). This HTTP header is often `X-Forwarded-For:` when traveling through a web proxy, but can vary. For example, the Akamai service uses `True-Client-IP:`. For deployment guidelines and mechanism details, see the *FortiWeb Administration Guide*: https://docs.fortinet.com/fortiweb/admin-guides **Caution:** To combat forgery, configure the IP addresses of load balancers and proxies that are trusted providers of this header. Also configure those proxies/load balancers to reject fraudulent headers, rather than passing them to FortiWeb.	`disable`
`x-forwarded-proto {enable | disable}`	Enable to add an `X-Forwarded-Proto:` header that indicates the protocol used in the client's original request. Requires Reverse Proxy or True Transparent Proxy mode.	`disable`
`x-forwarded-for-support {enable | disable}`	Enable to include the `X-Forwarded-For:` HTTP header on requests forwarded to your web servers. Behavior varies by the header already provided by the HTTP client or web proxy, if any: • **Header absent**—Add the header, using the source IP address of the connection. • **Header present**—Verify that the source IP address of the connection is present in this header's list of IP addresses. If it is not, append it. This option can be useful for web servers that log or analyze clients' IP addresses, and support the `X-Forwarded-For:` header. When this option is disabled, from the web server's perspective, all connections appear to be coming from the FortiWeb appliance, which performs network address translation (NAT). But when enabled, the web server can instead analyze this header to determine the source and path of the original client connection. This option applies only when FortiWeb is operating in Reverse Proxy mode or True Transparent Proxy.	`disable`

Variable	Description	Default
`x-real-ip {enable | disable}`	Enable to include the `X-Real-IP:` HTTP header on requests forwarded to your web servers. Behavior varies by the header already provided by the HTTP client or web proxy, if any. For details, see `x-forwarded-for-support {enable | disable}` (page 553)). Like `X-Forwarded-For:`, this header is also used by some proxies and web servers to trace the path, log, or analyze based upon the packet's original source IP address. This option applies only when FortiWeb is operating in Reverse Proxy or True Transparent Proxy mode.	`disable`
`x-forwarded-proto {enable | disable}`	Enable to add an HTTP header that indicates the service used in the client's original request. Usually if your FortiWeb is receiving HTTPS requests from clients, and it is operating in Reverse Proxy mode, SSL/TLS is being offloaded. FortiWeb has terminated the SSL/TLS connection and the second segment of the request, where it forwards to the back-end servers, is clear text HTTP. In some cases, your back-end server may need to know that the original request was, in fact, encrypted HTTPS, **not** HTTP.	`disable`
`<entry_index>`	Enter the index number of the individual entry in the table. The valid range is 1–9,223,372,036,854,775,807. Each list can contain a maximum of 256 IP addresses.	No default.
`ip "<load-balancer_ip>"`	Type the IP address of a load balancer or proxy that is in front of the FortiWeb appliance (between the client and FortiWeb). To apply anti-spoofing measures and improve security, FortiWeb trusts the contents of the HTTP header that you specify in `original-ip-header "<http-header-key_str>"` (page 552) **only** if the packet arrived from one of the IP addresses you specify here. It regards `original-ip-header "<http-header-key_str>"` (page 552) from other IP addresses as potentially spoofed. For packets from other IP addresses, FortiWeb ignores the `X-Forwarded-For:` header and uses the source IP address in the IP header as the client source address. This IP address is displayed in the attack log message.	No default.

Example

The following example defines a X-Forwarded-For rule that adds `X-Forwarded-For:`, `X-Real-IP:`, and `X-Forwarded-Proto:` headers to traffic that FortiWeb forwards to a back-end server. It enables FortiWeb to use the HTTP X-Header to identify and block the original client's IP. To protect against XFF spoofing, it also specifies the trusted load-balancer `192.0.2.105` in the X-Forwarded-For IP list.

```
config waf x-forwarded-for
   edit "load-balancer1"
      set x-forwarded-for-support enable
      set tracing-original-ip enable
      set original-ip-header X-FORWARDED-FOR
      set x-real-ip enable
      set x-forwarded-proto enable
      config ip-list
         edit 1
            set ip "192.0.2.105"
         next
      end
      set block-based-on-original-ip enable
   next
end
```

waf xml-schema

Use this command to view XML schema files that have already been uploaded to FortiWeb. You can upload XML schema files only in the web UI.

XML schema files specify the acceptable structure of an elements in an XML document. When you use XML schema files to check XML content in HTTP requests, FortiWeb can determine whether content is allowed and validate that content is well-formed.

XML schema files are included in XML protection rules. XML protection rules define acceptable parameters for XML content in HTTP requests. Groups of XML protection rules are grouped into XML protection policies. For details, see "waf xml-validation" on page 556.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf xml-schema file
   edit "<xml_schema_file_name>"
end
```

Variable	Description	Default
`"<xml_schema_file_name>"`	To display a list of existing XML schema files, enter: `edit ?`	No default.

waf xml-validation

Use this command to create XML protection rules and configure XML protection policies. You can create up to 256 rules per policy.

XML is commonly used for data exchange, and hackers sometimes try to exploit security holes in XML to attack web servers. Using this command, you can configure FortiWeb to examine lcient requests for anomalies in XML. Configuring XML protection can help ensure that the content of HTTP requests containing XML does not contain any potential attacks.

XML protection is available in Reverse Proxy, Offline Protection, True Transparent Proxy, Transparent Inspections, and WCCP operating modes.

Syntax

```
config waf xml-validation rule
   edit "<xml_rule_name>"
      set action {alert | alert_deny | block-period | redirect | send_403_forbidden |
          deny_no_log}
      set block-period <period_int>
      set expansion-entity-check {enable | disable}
      set external-entity-check {enable | disable}
      set host "<host_name_str>"
      set host-status {enable | disable}
      set request-file "<file_str>"
      set request-type {plain | regular}
      set schema-file "<schema_file_name>"
      set severity {High  Low | Medium | Info}
      set trigger "<trigger_policy_name>"
      set xml-entity-check {enable | disable}
      set xml-limit-attr-num <limit_int>
      set xml-limit-attrname-len <limit_int>
      set xml-limit-attrvalue-len <limit_int>
      set xml-limit-cdata-len <limit_int>
      set xml-limit-check {enable | disable}
      set xml-limit-element-depth <limit_int>
      set xml-limit-element-name-len <limit_int>
      set data-format {xml | soap}
      set wsdl-file <wsdl-file_name>
      set validate-soapaction {enable | disable}
      set validate-soap-headers {enable | disable}
      set allow-additional-soap-headers {enable | disable}
      set validate-soap-body {enable | disable}

   next
end
config waf xml-validation policy
   edit "<xml_policy_name>"
      config input-rule-list
```

```
        edit <entry_index>
          set "<xml_rule_1>"
        next
      end
    next
  end
```

Variable	Description	Default
"<xml_rule_name>"	Enter a name that can be referenced by other parts of the configuration. You will use the name to select the rule in an XML protection policy. The maximum length is 63 characters.	No default.
action {alert | alert_deny | block-period | redirect | send_403_forbidden | deny_no_log}	Select one of the following actions that FortiWeb performs when a request violates the rule: • alert—Accept the request and generate an alert email and/or log message. • alert_deny—Block the request (or reset the connection) and generate an alert email and/or log message. You can customize the web page that FortiWeb returns to the client with the HTTP status code. For details, see "system replacemsg" on page 296. • block-period—Block subsequent requests from the client for a number of seconds. Also configure waf xml-validation (page 556). • redirect—Redirect the request to the URL that you specify in the protection profile and generate an alert email and/or log message. Also configure redirect-url "<redirect_fqdn>" (page 539) and rdt-reason {enable | disable} (page 539). • send_403_forbidden—Reply to the client with an HTTP 403 Access Forbidden error message and generate an alert email and/or log message. • deny_no_log—Deny a request. Do not generate a log message. **Caution:**FortiWeb ignores this setting when monitor-mode {enable | disable} (page 146) is enabled. **Note:** Logging and/or alert email will occur only if enabled and configured. For details, see "log disk" on page 77 and "log alertMail" on page 71. **Note:** If you select an auto-learning profile with this rule, you should select alert. If the action is alert_deny,	alert

Variable	Description	Default
	for example, the FortiWeb appliance will block the request or reset the connection when it detects an attack, resulting in incomplete session information for the auto-learning feature. For details about auto-learning requirements, see "waf web-protection-profile autolearning-profile" on page 1.	
`block-period <period_int>`	Enter the amount of time (in seconds) that you want to block subsequent requests from a client after FortiWeb detects a rule violation. This setting is available only when `waf xml-validation` (page 556) is `block-period`. The valid range is 1–3,600.	`60`
`expansion-entity-check {enable | disable}`	Enable to trigger the `waf xml-validation` (page 556) if an HTTP request contains an XML recursive entity expansion. To enable this option, you must first enable `waf xml-validation` (page 556).	`disable`
`external-entity-check {enable | disable}`	Enable to trigger the `waf xml-validation` (page 556) if an HTTP request contains an external entity in XML. To enable this option, you must first enable `waf xml-validation` (page 556).	`disable`
`host "<host_name_str>"`	Enter the name of a protected host that the `Host:` field of an HTTP request must match in order for the rule to apply. For details, see "server-policy allow-hosts" on page 112.	No default.
`host-status {enable | disable}`	Enable to compare the XML rule to the Host: field in the HTTP header. If enabled, also configure `waf xml-validation` (page 556).	`disable`
`request-file "<file_str>"`	Depending on your selection for `waf xml-validation` (page 556), enter either: • `plain`—The literal URL, such as `/index.php`, that the HTTP request must contain in order to match the rule. The URL must begin with a slash (`/`). • `regular`—A regular expression, such as `^/*.php`, matching the URLs to which the rule should apply. The pattern does not require a slash (`/`), but it must match URLs that begin with a slash, such as `/index.cfm`. Do not include the domain name, such as `www.example.com`, which is configured separately in `waf xml-validation` (page 556).	No default.

Variable	Description	Default
`request-type {plain | regular}`	Select whether `waf xml-validation` (page 556) must contain either: • **Simple String**—The field is a string that the request URL must match exactly. • **Regular Expression**—The field is a regular expression that defines a set of matching URLs.	No default.
`schema-file "<schema_file_name>"`	Select an XML schema file. To display a list of existing XML schema files, enter: `set schema-file ?` Note, if you select an XML schema file that references other XML schema files, the other XML schema files must also be uploaded to FortiWeb.	No default.
`severity {High Low | Medium | Info}`	When rule violations are recorded in the attack log, each log message contains a **Severity Level** field. Select which severity level FortiWeb will use when it logs a violation of the rule: • `Low` • `Medium` • `High` • `Info`	`Low`
`trigger "<trigger_policy_name>"`	Enter the name of the trigger, if any, to apply when the rule is violated. The maximum length is 63 characters. For details, see "log trigger-policy" on page 105. To display a list of existing triggers, enter: `set trigger ?`	No default.
`xml-entity-check {enable | disable}`	Enable to configure `waf xml-validation` (page 556) and `waf xml-validation` (page 556).	`disable`
`xml-limit-attr-num <limit_int>`	Enter the maximum number of attributes for each element. The valid range is 1–256. To configure this option, you must first enable `waf xml-validation` (page 556).	`20`
`xml-limit-attrname-len <limit_int>`	Enter the maximum attribute name length (in bytes) of each element. The valid range is 1–1,024. To configure this option, you must first enable `waf xml-validation` (page 556).	`64`

Variable	Description	Default
`xml-limit-attrvalue-len <limit_int>`	Enter the maximum attribute value length (in bytes) of each element. The valid range is 1–2,048. To configure this option, you must first enable `waf xml-validation` (page 556).	`1,024`
`xml-limit-cdata-len <limit_int>`	Enter the maximum Character Data (CDATA) length (in bytes) in XML. The valid range is 1–4,096. To configure this option, you must first enable `waf xml-validation` (page 556).	`4,096`
`xml-limit-check {enable | disable}`	Enable to configure XML limits.	`disable`
`xml-limit-element-depth <limit_int>`	Enter the maximum element depth in XML. The valid range is 1–256. To configure this option, you must first enable `waf xml-validation` (page 556).	`20`
`xml-limit-element-name-len <limit_int>`	Enter the maximum element name length (in bytes) in XML. The valid range is 1–1,024. To configure this option, you must first enable `waf xml-validation` (page 556).	`64`
`"<xml_policy_name>"`	Enter the name of an XML protection policy. You will use the name to select the policy in other parts of the configuration. The maximum length is 63 characters.	No default.
`<entry_index>`	Enter the index number of an entry to create or modify a rule for the policy. The valid range is 1–9,999,999,999,999,999,999.	No default.
`"<xml_rule_1>"`	Enter the sequence number of an XML protection rule to add to the XML protection policy. The maximum length is 63 characters.	No default.
`data-format {xml | soap}`	Select the XML protection rule format.	No default.
`wsdl-file <wsdl-file_name>`	This field applies When the Data Format is SOAP. Enter a name for the WSDL file.	No default.
`validate-soapaction {enable | disable}`	Enable to validate whether the soapAction in SOAP protocol complies with that in WSDL file.	No default.
`validate-soap-headers`	Enable to validate whether the header elements in SOAP	No default.

Variable	Description	Default
`{enable | disable}`	protocol comply with those in WSDL file.	
`allow-additional-soap-headers {enable | disable}`	Enable not to validate additional header elements.	No default.
`validate-soap-body {enable | disable}`	Enable to validate whether the body elements in SOAP protocol comply with those in WSDL file.	No default.

Example

The below example creates an XML protection rule and applies the rule to a new XML protection policy.

```
config waf xml-validation rule
   edit "example_rule_name_1"
      set action block-period
      set block-period 3000
      set severity Medium
      set trigger "example_trigger_policy_name"
      set host-status enable
      set host "example_host_name"
      set request-type plain
      set request-file "/index.php"
      set schema-file "example_schema_file_name"
      set xml-limit-check enable
      set xml-limit-attr-num 64
      set xml-limit-attrname-len 256
      set xml-limit-attrvalue-len 1024
      set xml-limit-cdata-len 2096
      set xml-limit-element-depth 128
      set xml-limit-element-name-len 128
      set xml-entity-check enable
      set expansion-entity-check enable
      set external-entity-check enable
   next
end
config waf xml-validation policy
   edit "example_policy_name"
      config input-rule-list
         edit "example_rule_1"
            set "example_rule_1"
         next
      end
   next
end
```

- "waf web-protection-profile inline-protection" on page 528

waf xml-wsdl

Use this command to view XML wsdl files that have already been uploaded to FortiWeb. You can upload XML wsdl files only in the web UI.

WSDL files are XML files that describe how to use SOAP to invoke web service. To configure FortiWeb to verify legality of WSDL files and check the SOAP message against WSDL and SOAP protocol, create an XML protection rule and select a WSDL file for that rule. You can select only one WSDL file for each XML protection rule, but you can configure FortiWeb to enforce multiple rules in XML protection policies.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wafgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config waf xml-wsdl file
   edit "<xml_wsdl_file_name>"
end
```

Variable	Description	Default
`"<xml_wsdl_file_name>"`	To display a list of existing XML WSDL files, enter: `edit ?`	No default.

Related topics

- "waf xml-validation" on page 556

wvs limit

Use this command to limit scanning related settings, such as the scanning report size, request interval, etc.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wvsgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config wvs limit
   set report-path-size <report-path-size_int>
   set request-interval <request-interval_int>
   set scan-cpu-usage <scan-cpu-usage_int>
   set scan-memory-usage <scan-memory-usage_int>
   set single-report-size <single-report-size_int>
   set verbose-output {enable | disable}
end
```

Variable	Description	Default
`report-path-size <report-path-size_int>`	Type the size of the folders that store all scanning reports of all policies (1024~51200 M)	`10240`
`request-interval <request-interval_int>`	Type the number of seconds between each request (1~1000 ms).	`1`
`scan-cpu-usage <scan-cpu-usage_int>`	Set the CPU limit. When the CPU of all scanning processes exceeds certain parentage of the total CPU, the scanning will be killed (10~80 percent).	`70`
`scan-memory-usage <scan-memory-usage_int>`	Set the memory limit. When the memory of all scanning processes exceeds certain parentage of the total memory , the scanning will be killed (10~80 percent).	`40`
`single-report-size <single-report-size_int>`	The size of the scanning report file for the first scanning in a single policy (1~5120 M).	`512`
`verbose-output {enable | disable}`	Control the `output.txt` contents. Enable to output detailed debug information, which causes large `output.txt` file.	`disable`

Example

This example shows how to configure scanning related limitations.

```
config wvs limit
   set report-path-size 10500
   set request-interval 3
   set scan-cpu-usage 60
   set single-report-size 700
   set verbose-output disable
end
```

wvs policy

Use this command to define a web vulnerability scan policy. The policy enables you to set the frequency of the vulnerability scan, schedule the scan, and choose a format for the scan report. The policy also enables you to select an email policy that determines who receives the scan report.

Before you can complete a web vulnerability scan policy, you must first configure a scan profile using the FortiWeb web UI and a scan schedule using either the web UI or the command `config wvs schedule` (page 569).

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wvsgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config wvs policy
   edit "<wvs-policy_name>"
      set type {runonce | schedule}
      set schedule "<wvs-schedule_name>"
      set profile "<wvs-profile_name>"
      set email "<email-policy_name>"
      set report_format {html | pdf | xml}
      set runtime <count_int>
   next
end
```

Variable	Description	Default
`"<wvs-policy_name>"`	Enter the name of a new or existing web vulnerability scan policy. The maximum length is 63 characters. To display the list of existing policies, enter: `edit ?`	No default.
`type {runonce | schedule}`	Select either: • `runonce`—Run the scan immediately after you complete the policy. • `schedule`—Run the scan on a schedule. Also configure `analyzer-policy "<fortianalyzer-policy_name>"` (page 106).	`runonce`
`schedule "<wvs-schedule_name>"`	Enter the name of an existing web vulnerability scan schedule. The maximum length is 63 characters. For details, see "wvs schedule" on page 569. To display the list of existing schedules, enter: `set schedule ?` This setting is applicable only if `type {runonce | schedule}` (page 564) is `schedule`.	No default.
`profile "<wvs-profile_name>"`	Enter the name of an existing web vulnerability scan profile. The maximum length is 63 characters. To display a list of the existing profiles, enter: `set profile ?`	No default.
`email "<email-policy_name>"`	Enter the name of an existing email policy. When the scan completes, the FortiWeb appliance will send email in the	No default.

Variable	Description	Default
	specified format to the email addresses in the policy. The maximum length is 63 characters. For details, see "log email-policy" on page 79. To display the list of existing policy, enter: `set email ?`	
`report_format {html | pdf | xml}`	Select one or more file formats of the report to attach when emailing it.	`html`
`runtime <count_int>`	Not configurable. To reset the value to zero, enter: `set runtime 0`	No default.

Example

The following example defines a recurring vulnerability scan with email report output in RTF and text format.

```
config wvs policy
   edit "wvs-policy1"
      set type schedule
      set schedule "wvs-schedule1"
      set report_format xml
      set profile "wvs-profile1"
      set email "EmailPolicy1"
   next
end
```

wvs profile

Use this command to configure web vulnerability scan profiles.

A web vulnerability scan (WVS) profile defines the web server to scan, as well as the specific vulnerabilities to scan for. The WVS profiles are associated with WVS policies, which determine when to perform the scan and how to publish the results of the scan defined by the profile.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wvsgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config wvs profile
```

```
    edit "<wvs_profile_name>"
      set scan-target <scan-target_str>
      set scan-template <scan-template_id>
      set request-timeout <request-timeout_int>
      set ignore-session-cookies {enable | disable}
      set user-agent-type {custom | random}
      set custom-user-agent <custom-user-agent_str>
      set custom-header0 <custom-header0_str>
      set custom-header1 <custom-header1_str>
      set custom-header2 <custom-header2_str>
      set custom-header3 <custom-header3_str>
      set custom-header4 <custom-header4_str>
      set custom-header5 <custom-header5_str>
      set custom-header6 <custom-header6_str>
      set custom-header7 <custom-header7_str>
      set custom-header8 <custom-header8_str>
      set custom-header9 <custom-header9_str>
      set sub-path-limit <sub-path-limit_int>
      set max-scan-time <max-scan-time_int>
      set max-crawl-time <max-crawl-time_int>
      set max-params-limit <max-params-limit_int>
      set max-file-size <max-file-size_int>
      set max-http-retries <max-http-retries_int>
      set specify-urls-for-scanning {enable | disable}
      set follow-regex <follow-regex_int>
      set ignore-regex <ignore-regex_int>
      set http-basic-authentication {enable | disable}
      set basic-username <basic-username_str>
      set basic-password <basic-password_str>
      set form-based-authentication {enable | disable}
      set form-based-username <form-based-username_str>
      set form-based-password <form-based-password_str>
      set form-based-auth-url <form-based-auth-url_str>
      set username-field <username-field_str>
      set password-field <password-field_str>
      set cookie-jar-file <cookie-jar-file_str>
      set session-check-url <session-check-url_str>
      set "wvs profile" on page 569
      set data-format <data-format_str>
    end
```

Variable	Description	Default
"<wvs_profile_name>"	Type a unique name for the profile name. The maximum length is 63 characters.	No default.
scan-target <scan-target_str>	Enter the URL that you want to scan, such as www.mytestwvs.com.	No default.
scan-template <scan-template_id>	Select an existing scan template that you want to use in the profile.	No default.
request-timeout <request-timeout_int>	Type the number of seconds for the vulnerability scanner to	No default.

Variable	Description	Default
	wait for a response from the website before it assumes that the request will not successfully complete, and continues with the next request in the scan. It will not retry timeout requests.	
`ignore-session-cookies {enable | disable}`	If enabled, the scanner will ignore all session cookies sent by the target web application.	No default.
`user-agent-type {custom | random}`	`Custom`: when there is no user-agent in custom headers, the actual user-agent sent is FortiWeb WVS; when user-agent is set in custom headers, the actual user-agent sent is the value set in `custom-user-agent <custom-user-agent_str>`. `random`: When the user-agent-type is random, and there is no user-agent in custom headers, the actual user-agent sent is random; when user-agent is set in custom headers, the actual user-agent sent is random.	`custom`
`custom-user-agent <custom-user-agent_str>`	Enter the custom user-agent value.	No default.
`custom-header0 <custom-header0_str>`	You can define the host, user agent, and other common headers in the request.	No default.
`custom-header1 <custom-header1_str>`	You can define the host, user agent, and other common headers in the request.	No default.
`custom-header2 <custom-header2_str>`	You can define the host, user agent, and other common headers in the request.	No default.
`custom-header3 <custom-header3_str>`	You can define the host, user agent, and other common headers in the request.	No default.
`custom-header4 <custom-header4_str>`	You can define the host, user agent, and other common headers in the request.	No default.
`custom-header5 <custom-header5_str>`	You can define the host, user agent, and other common headers in the request.	No default.
`custom-header6 <custom-header6_str>`	You can define the host, user agent, and other common headers in the request.	No default.
`custom-header7 <custom-header7_str>`	You can define the host, user agent, and other common headers in the request.	No default.
`custom-header8 <custom-header8_str>`	You can define the host, user agent, and other common headers in the request.	No default.

Variable	Description	Default
`custom-header9 <custom-header9_str>`	You can define the host, user agent, and other common headers in the request.	No default.
`sub-path-limit <sub-path-limit_int>`	Enter the maximum number of requests for sub path of each URL.	No default.
`max-scan-time <max-scan-time_int>`	Enter the maximum scanning time.	No default.
`max-crawl-time <max-crawl-time_int>`	Enter the maximum crawling time (minutes).	No default.
`max-params-limit <max-params-limit_int>`	Enter the maximum number of requests for each URL, and parameter set.	No default.
`max-file-size <max-file-size_int>`	Indicate the maximum file size (in bytes) that the scanner will retrieve from the remote server.	No default.
`max-http-retries <max-http-retries_int>`	Indicate the maximum number of retries when requesting an URL. The valid value range is 1–10.	No default.
`specify-urls-for-scanning {enable | disable}`	Enable to specify the URL to be scanned.	`disable`
`follow-regex <follow-regex_int>`	`follow-regex` is `.*`. When crawling, do not follow links that match this regular expression.	No default.
`ignore-regex <ignore-regex_int>`	An empty string (nothing to be ignored), when crawling, only follow that matches this regular expression. `ignore-regex` has precedence over `follow-regex`.	No default.
`http-basic-authentication {enable | disable}`	Enable the HTTP basic authentication.	`disable`
`basic-username <basic-username_str>`	Enter the username of the web application.	No default.
`basic-password <basic-password_str>`	Enter the password for the username.	No default.
`form-based-authentication {enable | disable}`	Enable the form based authentication.	`disable`
`form-based-username <form-based-username_str>`	The username parameter name, for example, "uname" if the HTML looks like `<input type="text" name="uname">...`	No default.

Variable	Description	Default
`form-based-password <form-based-password_str>`	The password parameter name, for example, "pwd" if the HTML looks like `<input type="password" name="pwd">...`	No default.
`form-based-auth-url <form-based-auth-url_str>`	Enter the target URL for security auditing, and the URL shall include `http` or `https` tag.	No default.
`username-field <username-field_str>`	Enter the username for using in the authentication process.	No default.
`password-field <password-field_str>`	Enter the password for the username.	No default.
`cookie-jar-file <cookie-jar-file_str>`	Designate a cookie jar file. The cookie jar file must be in mozilla format.	No default.
`session-check-url <session-check-url_str>`	Enter the URL where the packets are sent to.	No default.
`session-check-str <session-check-url_str>`	Enter the string in the response message. If the string can be checked, the authentication succeeds; otherwise, the authentication will be re-launched.	No default.
`data-format <data-format_str>`	Add extra parameters here for authentication as required by some websites, for example, `%u=%U&%p=%P&security_level- 0&form-submit. The default value %u=%U&%p=%P` includes the values for Username Field and Password Field.	No default.

wvs schedule

Use this command to schedule a web vulnerability scan.

Vulnerability scanning can detect known vulnerabilities on your web servers and web applications, helping you to design protection profiles. Vulnerability scans start from an initial directory, then scan for vulnerabilities in web pages located in the same directory or subdirectory as the initial URL.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wvsgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config wvs schedule
   edit "<schedule_name>"
      set type {recurring | onetime}
      set date "<time_str>" "<date_str>"
      set time "<time_str>"
      set wday {Sunday Monday Tuesday Wednesday Thursday Friday Saturday}
   next
end
```

Variable	Description	Default
"<schedule_name>"	Enter the name of new or existing WVS schedule. The maximum length is 63 characters. To display the list of existing schedule, enter: edit ?	No default.
type {recurring | onetime}	Select either: • onetime—Run the scan only when an administrator manually initiates it. Also configure date "<time_str>" "<date_str>" (page 570). • recurring—Run the scan periodically, on a schedule. Also configure time "<time_str>" (page 570) and wday {Sunday Monday Tuesday Wednesday Thursday Friday Saturday} (page 571).	onetime
date "<time_str>" "<date_str>"	For a one-time web vulnerability scan, enter the time and date for the scan to run. The time format is hh:mm and the date format is yyyy/mm/dd, where: • hh is the hour according to a 24-hour clock • mm is the minute • yyyy is the year • mm is the month • dd is the day The yyyy range is 2001–2050. This only applies if type {recurring | onetime} (page 570) is onetime.	No default.
time "<time_str>"	Enter the time the vulnerability scan is to be performed. The time format is hh:mm, where: • hh is the hour according to a 24-hour clock • mm is the minute	No default.

Variable	Description	Default
	This only applies if `type {recurring | onetime}` (page 570) is `recurring`.	
`wday {Sunday Monday Tuesday Wednesday Thursday Friday Saturday}`	For a recurring scan only, enter one or more days of the week the scan is to be performed. This setting only applies if `type {recurring | onetime}` (page 570) is `recurring`.	No default.

Example

The following example schedules a recurring vulnerability scan to run every Sunday and Thursday at 1:00 AM.

```
config wvs schedule
   edit "WVS-schedule1"
      set type recurring
      set time 01:00
      set wday Sunday Thursday
   next
end
```

wvs template

Use this command to pre-define the scan profile.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `wvsgrp` area. For details, see "Permissions" on page 55.

Syntax

```
config wvs template
   edit "<wvs_template_name>"
      set template {audit | bruteforce | evasion | crawl | grep | infrastructure}
end
```

Variable	Description	Default
`"<wvs_template_name>"`	Enter a name for the scan template.	No default.
`template {audit | bruteforce | evasion | crawl | grep | infrastructure}`	Configure the plugins for a scan template.	No default.

Example

This example shows how to configure a wvs template.

```
config wvs template1
   edit template1
      set audit
end
```

diagnose

The `diagnose` commands display diagnostic information that help you troubleshoot problems. These commands do not have an equivalent in the web UI.

This section describes the following commands:

```
                                        debug trace
                                        report

                                        debug trace
                                        tcpdump

                                        hardware cpu

                                        debug reset

                                        debug upload

                                        hardware
                                        harddisk

                                        hardware
                                        interrupts

                                        hardware
                                        logdisk info

                                        hardware mem

                                        hardware nic
```

debug

Use this command to turn debug log output on or off.

Debug logging can be very resource intensive. To minimize the performance impact on your FortiWeb appliance, use packet capture only during periods of minimal traffic, with a local console CLI connection rather than a Telnet or SSH CLI connection, and be sure to stop the command when you are finished.

By default, the most verbose logging that is available from the web UI for any log type is the **Information** severity level. Due to their usually unnecessary nature, logs at the severity level of **Debug** are disabled and hidden. They can only be enabled and viewed from the CLI. Typically this is done only if your configuration seems to be correct, you cannot diagnose the problem without more information, and possibly suspect that you may have found either a hardware failure or software bug.

To generate debug logs, you must:

1. Set the verbosity level for the specific module whose debugging information you want to view, via a debug log command such as:

   ```
   debug application hasync {0 | 1 | 2 | 3 | 4 | 5 | 6 | 7}
   ```
   (page 581)

2. If necessary configure any filters specific to the module whose debugging information you are viewing, such as:

   ```
   debug flow filter server-ip "10.0.0.10"
   ```

3. If necessary start debugging specific to the module, such as:

   ```
   debug flow trace start
   ```

4. Enable debug logs overall. To do this, enter:

```
debug enable
```

5. View the debug logs. For convenience, debugging logs are immediately outputted to your local console display or terminal emulator, but debug log files can also be uploaded to a server.

   To do this, use the command:

   ```
   debug upload
   ```

   For more complex issues or bugs, this may be required in order to send debug information to Fortinet Customer Service & Support (https://support.fortinet.com).

Debug logs will be generated only if the application is running. To verify this, use `diagnose system top` (page 635). Otherwise, use `diagnose debug crashlog` (page 594) instead.

6. The CLI will display debug logs as they occur until you either:

   - Disable it by either typing:

     ```
     diagnose debug disable
     ```

     or setting all modules' debug log verbosity back to `0`. To reset all verbosity levels simultaneously, you can use the command:

     ```
     diagnose debug reset
     ```

   - Close your terminal emulator, thereby ending your administrative session.
   - Send a termination signal to the console by pressing Ctrl+C.
   - Reboot the appliance. To do this, you can use the command:

     ```
     execute reboot
     ```

     To use this command, your administrator account's access control profile requires only `r` permission in any profile area.

Syntax

```
diagnose debug {enable | disable}
```

Variable	Description	Default
`debug {enable | disable}`	Select whether to enable or disable recording of logs at the debug severity level.	`disable`

Related topics

- "debug application dssl" on page 579
- "debug application fds" on page 580

debug application autolearn

Use this command to view and set the verbosity level of debug logs for auto-learning.

Before you can see any debug logs, you must first enable debug log output using the command debug.

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application autolearn <autolearn_int>
```

Variable	Description	Default
`autolearn <autolearn_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables debug logs for auto-learning and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level. For example: `autolearn debug level is 0`	`0`

debug application confd-hamsg

Use this command to set the verbosity level and type of debug logs for HA synchronization.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 1).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 1.

Syntax

```
diagnose debug application confd-hamsg {0 | 1 | 2 | 3 | 4 | 5 | 6 | 7}
```

Variable	Description	Default
`confd-hamsg {0 | 1 | 2 | 3 | 4 | 5 | 6 | 7}`	Enter the number indicating the verbosity level and type of debugging messages to output to the CLI display after the command executes. • 0—Do not display messages. • 1—Display the process initialization failure message. • 2—None. • 3—Display MD5 checksums message of local host. • 4—Display messages that the local host has received and need to be synchronized. • 5—Display messages about member change and HA mode that the local host has received.. • 6—Display detailed messages of information to be synchronized. • 7—Display all messages. If you omit the number, the CLI displays the current verbosity level: `hasync debug level is 0`	0

Example

This example enables diagnostic debug logging in general, then specifically enables packet transmission logging of the HA synchronization daemon, `confd-hamsg`.

```
diagnose debug enable
diagnose debug application confd-hamsg 5
```

The CLI displays output such as the following until the command is terminated:

```
(./lib/confd_generate_md5.c : 103 ) request generate md5sum!
(./lib/confd_generate_md5.c : 149 ) generate md5sum done!

debug application detect

Use this command to set the verbosity level of debug logs for intrusion detection.

Before you can see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application detect <detect_int>
```

Variable	Description	Default
`detect <detect_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables debug logs for intrusion detection and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level: `detect debug level is 0`	`0`

- "debug upload" on page 605

debug application dssl

Use this command to set the verbosity level of debug logs for SSL inspection (temporary decryption in order to enforce policies). SSL inspection is used only when FortiWeb is operating in a mode that supports it, such as Transparent Inspection mode or Offline Protection mode.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application dssl <dssl_int>
```

Variable	Description	Default
`dssl <dssl_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables debug logs for SSL inspection and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level. For example: `dssl debug level is 0`	`0`

debug application fds

Use this command to set the verbosity level of debug logs for update requests to the Fortinet Distribution Network (FDN).

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application fds <fds_int>
```

Variable	Description	Default
`fds <fds_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables debug logs for FDN updates and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level. For example: `fds debug level is 0`	`0`

Related topics

debug application hasync

Use this command to set the verbosity level and type of debug logs for HA synchronization.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application hasync {0 | 1 | 2 | 3 | 4 | 5 | 6 | 7}
```

Variable	Description	Default
`hasync {0 | 1 | 2 | 3 | 4 | 5 | 6 | 7}`	Enter the number indicating the verbosity level and type of debugging messages to output to the CLI display after the command executes. • 0—Do not display messages. • 1—Display the process initialization failure message. • 2—None. • 3—Display MD5 checksums message. • 4—Display transmission loading message. • 5—Display network transmission messages, such as ARP broadcasts and bridge down/up status changes. • 6—Display more detailed packet transmission messages. • 7—Display all messages. If you omit the number, the CLI displays the current verbosity level: `hasync debug level is 0`	0

Example

This example enables diagnostic debug logging in general, then specifically enables packet transmission logging of the HA synchronization daemon, `hasyncd`.

```
diagnose debug enable
diagnose debug application hasync 5
```

The CLI displays output such as the following until the command is terminated:

```
(./lib/confd_send_queue.c : 58 ) add request to ha sendqueue success len:626
(./lib/confd_send_queue.c : 171 ) Read send request from local, len = 626 element type:1

debug application hatalk

Use this command to set the verbosity level and type of debug logs for HA heartbeats.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application hatalk {0 | 1 | 2 | 3 | 4 | 5 | 6 | 7}
```

Variable	Description	Default
`{0 | 1 | 2 | 3 | 4 | 5 | 6 | 7}`	Enter the number indicating the verbosity level and type of debugging messages to output to the CLI display after the command executes. • 0—Do not display messages. • 1—Display heartbeat process initialization messages. • 2—Display monitor port related messages. • 3—Display member change, external process communication related messages. • 4—None. • 5—Display member massages sent to Kernal. • 6—Display current status, and role messages. • 7—Display all messages. If you omit the number, the CLI displays the current verbosity level: `hatalk debug level is 0`	0

Example

This example enables diagnostic debug logging in general, then specifically enables complete debug logging of the HA heartbeat daemon, `hatalkd`.

```
diagnose debug enable
diagnose debug application hatalk 6
```

The CLI displays output such as the following until the command is terminated:

```
FortiWeb # (ha_timer.c : 305) [87040]syncronized 2 nodes!
(ha_timer.c : 428) hamain[87040949] mode 2, role 1,1, phase 2, narps 0, skip 0

debug application http

Use this command to set the verbosity level of debug logs for the HTTP protocol parser. This parser module dissects the HTTP headers and content body for analysis by other modules such as rewriting, HTTP protocol constraints, server information disclosure, and attack signature matching.

If the debug logs indicate that the HTTP protocol parser may be encountering an error condition, you can temporarily disable it and allow packets to bypass it to verify if this is the case. For details, see `noparse {enable | disable}` (page 147).

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application http <http_int>
```

Variable	Description	Default
`http <http_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables debug logs for the HTTP protocol parser and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level. For example: `http debug level is 0`	`0`

debug application miglogd

Use this command to set the verbosity level of debug logs for the log daemon, `miglogd`.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application miglogd <miglogd_int>
```

Variable	Description	Default
`miglogd <miglogd_int>`	Specify the verbosity level to output to the CLI display after the	`0`

Variable	Description	Default
	command executes. The valid range is 0–7, where 0 disables debug logs for the log daemon and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level. For example: `miglogd debug level is 0`

debug application mulpattern

Use this command to set the verbosity level of debug logs for the pattern matching module.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application mulpattern <mulpattern_int>
```

Variable	Description	Default
`mulpattern <mulpattern_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables debug logs for the pattern matching module and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level. For example: `mulpattern debug level is 0`	`0`

debug application proxy

Use this command to set the verbosity level of debug logs for flow through the XML application proxy.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application proxy <proxy_int>
```

Variable	Description	Default
`proxy <proxy_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables debug logs for the XML application proxy flow and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level. For example: `proxy debug level is 0`	`0`

Related topics

debug application proxy-error

Use this command to set the verbosity level of debug logs for errors in the XML application proxy.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application proxy-error {-1 | 0}
```

Variable	Description	Default
`proxy-error {-1 | 0}`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables debug logs for XML application proxy errors and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level. For example: `proxy-error debug level is 0`	`0`

debug application snmp

Use this command to debug the SNMP daemon.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application snmp <snmp_int>
```

Variable	Description	Default
`snmp <snmp_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables SNMP debugging and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level: `snmp debug level is 0`	`0`

Related topics

debug application ssl

Use this command to set the verbosity level of debug logging for SSL/TLS offloading. SSL offloading is supported only when the FortiWeb appliance is operating in Reverse Proxy or True Transparent Proxy mode.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application ssl <ssl_int>
```

Variable	Description	Default
`ssl <ssl_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables debug logging of SSL/TLS offloading and 7 generates the most verbose logging.	`0`

Variable	Description	Default
	If you omit the number, the CLI displays the current verbosity level. For example: `ssl debug level is 0`	

Example

This example enables diagnostic debug logging overall, then specifically enables debug logging for SSL in Reverse Proxy mode.

```
diagnose debug enable
diagnose debug application ssl
```

debug application sysmon

Use this command to debug the system monitor.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application sysmon <sysmon_int>
```

Variable	Description	Default
`sysmon <sysmon_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables system monitor debugging and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level. For example: `sysmon debug level is 0`	`0`

debug application ustack

Use this command to set the verbosity level of debug logs for the user-space TCP/IP connectivity stack.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application ustack <ustack_int>
```

Variable	Description	Default
`ustack <ustack_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables debug logging of the user-space TCP/IP connectivity stack and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level. For example: `ustack debug level is 0`	`0`

debug application waf-fds-update

Use this command to debug the FortiGuard service update processs.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug application waf-fds-update <update_int>
```

Variable	Description	Default
`waf-fds-update <update_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables FortiGuard Distribution Server (FDS) update debugging and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level. For example: `waf-fds-update debug level is 0`	`0`

debug cli

Use this command to set the debug level for the command line interface (CLI).

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug cli <cli_int>
```

Variable	Description	Default
`cli <cli_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables debug logs for the CLI and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity level. For example: `cli debug level is 0`	`3`

Related topics

debug cmdb

Use this command to enable the debug log for the configuration management database (CMDB).

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug cmdb <cmdb_int>
```

Variable	Description	Default
`cmdb <cmdb_int>`	Specify the verbosity level to output to the CLI display after the command executes. The valid range is 0–7, where 0 disables SNMP debugging and 7 generates the most verbose logging. If you omit the number, the CLI displays the current verbosity	`0`

Variable	Description	Default
	level: `cmdb debug level is 0`	

Related topics

- "debug" on page 574
- "debug console timestamp" on page 593
- "debug info" on page 601

debug console timestamp

Use this command to enable or disable the timestamp in debug logs.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug console timestamp {enable | disable}
```

Variable	Description	Default
`timestamp {enable | disable}`	Enable to add timestamps to debug output. If you omit the selection, the CLI displays the current timestamp status: `console timestamp is disabled.`	`disable`

Related topics

- "debug reset" on page 603

debug coredumplog

Use this command to record the stack information in the core file of the proxyd program.

Before you will be able to see any debug logs, you must first enable debug log output using the command `enable-debug-log {enable | disable}` (page 301).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug coredumplog show
diagnose debug coredumplog clear
```

Related Topic

- "debug" on page 574

debug crashlog

Use this command to show crash logs from application proxies that have call back traces, segmentation faults, or memory register dumps, or to delete the crash log.

Before you will be able to see any debug logs, you must first enable debug log output using the command `enable-debug-log {enable | disable}` (page 301).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug crashlog show
diagnose debug crashlog clear
```

Example

```
diagnose debug crashlog show
```

Output similar to the following appears in the CLI:

```
2011-02-08 06:20:46 <18632> firmware FortiWeb-1000B 4.20,build0403,110131

```

debug daemonlog

Use this command to process call information on specific interface records.

Before you will be able to see any debug logs, you must first enable debug log output using the command `enable-debug-log {enable | disable}` (page 301).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug daemonlog show
diagnose debug daemonlog clear
```

Related Topic

- "debug" on page 574

debug dnsproxy list

Use this command to display the DNS cache that stores the results of resolving all fully qualified domain names in the server pools.

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug dnsproxy list
```

Example

```
diagnose debug dnsproxy list
```

If the domain specified for the server pool member is `www.example.org` and has resolved to `10.20.5.12`, output similar to the following is displayed:

```
www.example.org
10.20.5.12
10:20::5:12
```

Related topics

- "system dns" on page 237

debug emerglog

Use this command to view or erase disk read-only error logs.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug emerglog {show | clear}
```

Variable	Description	Default
{show | clear}	Enter `show` to view disk read-only error logs. Enter `clear` to delete error logs.	No default

debug flow filter

Use these commands to generate only packet flow debug logs that match your filter criteria, such as a specific destination IP address. You can also use these commands to delete the packet flow debug log filter, so that all packet flow debug logs are generated.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug flow filter reset
diagnose debug flow filter client-ip <source_ipv4 | source_ipv6>
diagnose debug flow filter server-ip <destination_ipv4 | destination_ipv6>
```

Variable	Description	Default
`client-ip <source_ipv4 | source_ipv6>`	Enter the source (`SRC`) IP address of connections. This will generate only packet flow debug log messages involving that source IP address. **Note:** This filter operates at the IP layer, **not** the HTTP layer. If a load balancer or other web proxy is deployed in front of FortiWeb, and therefore all connections for HTTP requests	No default.

Variable	Description	Default
	appear to originate from this IP address, configuring this filter will have no effect. Similarly, if multiple clients share an Internet connection via NAT or explicit web proxy, configuring this filter will only isolate connections that share this IP address. It will **not** be able to filter out a single client based on individual HTTP sessions from that IP.	
`server-ip <destination_ipv4 | destination_ipv6>`	Enter the destination (`DST`) IP address of the connection, either the: • Virtual server on FortiWeb (if FortiWeb is operating in Reverse Proxy mode) • Protected web server on the back end (all other operation modes) This will generate only packet flow debug log messages involving that server IP address.	No default.

Related topics

- "debug flow trace" on page 598

debug flow filter module-detail

Use this command to include or exclude debug logs from each FortiWeb feature module as the packet is processed when generating packet flow debug logs. This can be useful if you suspect that a module is encountering errors, or need to know which module is dropping the packet.

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug flow filter module-detail {on | off}
```

Variable	Description	Default
`module-detail {on | off}`	Select whether to include (`on`) or exclude (`off`) details from each module that processes the packet.	No default.

debug flow reset

Use this command to reset the configuration of packet flow debug log messages.

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug flow reset
```

Related topics

- "debug flow filter" on page 596
- "debug flow filter module-detail" on page 597

debug flow trace

Use this command to trace the flow of packets through the FortiWeb appliance's processing modules and network stack.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug flow trace {start | stop}
```

Variable	Description	Default
`trace {start | stop}`	Select whether to enable (`start`) or disable (`stop`) the recording of packet flow trace debug log messages.	No default.

Example

This example configures a filter based on the packet destination IP `192.0.2.48`, enables messages from each packet processing module, enables packet flow traces, then finally begins generating the debug logs that are enabled for output (in this case, only packet trace debug logs).

Because the filters are configured **before** debug logging is enabled, the administrator can type the filter without being interrupted by debug log output to the CLI.

```
diagnose debug flow filter server-ip 192.0.2.48
diagnose debug flow flow module-detail on
diagnose debug flow trace start
diagnose debug enable
```

Output:

```
FortiWeb # session_id=251 packet_id=0 policy_name=policy1 msg="Receive packet from client
    172.20.120.225:49428"
session_id=251 packet_id=0 msg="HTTP parsing client packet success"

diag debug disable

FortiWeb #
```

Session lines contain the name of the matching server policy (`policy_name`), the packet identifier (`packet_ID`), and TCP session ID (`session_id`), as well as a log message (`msg`) indicating one or more of the following:

- The source IP address and port number of the packet (e.g. `Receive packet from client 192.0.2.225:49428`)
- The success or failure of FortiWeb's HTTP parser's attempt to analyze the HTTP headers and payload of the packet into pieces that can be scanned or modified by modules (e.g. `HTTP parsing client packet success` or `Packet dropped by detection module,and module number=11`)

If the debug logs indicate that the HTTP protocol parser may be encountering an error condition, you can temporarily disable it and allow packets to bypass it to verify if this is the case. For details, see `noparse {enable | disable}` (page 147).

If enabled, module lines contain messages from each FortiWeb feature module as it processes the packet (e.g. `Module name:WAF_PROTECTED_SERVER_CHECK` for the feature that tests for an allowed `Host:` name in the request). The module logs are displayed in their order of execution; for details, see the *FortiWeb Administration Guide*:

https://docs.fortinet.com/fortiweb/admin-guides

These messages indicate:

- Whether or not the module executed, and if not, the reason (e.g. `Execution:1`)
- Processing errors, if any (e.g. `Process error:0`)
- Whether a module has allowed or blocked the packet (e.g. `Action:ACCEPT` or `Action:FOLLOWUP_ACCEP`)

For non-execution reasons, possible status codes are:

- `Execution:1`—The module is disabled, and therefore is being skipped.
- `Execution:2`—The module is not supported in the current deployment mode, and therefore is being skipped.
- `Execution:3`—The client IP address is whitelisted, and therefore the module is being skipped.
- `Execution:4`—URL access policy has caused the module to be skipped.

debug info

Use this command to display a list of debug log settings.

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug info
```

Example

```
diagnose debug application ssl 8
diagnose debug application dssl 8
diagnose debug application ustack 8
diagnose debug info
```

Output similar to the following appears in the CLI:

```
debug output: disable
console timestamp: disable
ssl debug level: 8
ustack debug level: 8
dssl debug level: 8
CLI debug level: 3
```

If you have not modified any verbosity levels, only this default output appears:

```
FortiWeb # diagnose debug info
debug output: disable
console timestamp: disable
```

```
CLI debug level: 3
```

debug init

Use this command to record packet flow trace log messages.

Before you will be able to see any debug logs, you must first enable debug log output using the command `diagnose debug` (page 574).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug init {enable | disable}
```

Variable	Description	Default
`init {enable | disable}`	Select whether to enable (`start`) or disable (`stop`) the recording of packet flow trace debug log messages. If you omit the selection, the CLI displays the current timestamp status: `init output: disabled`	No default.

debug kernlog

Use this command to record the print information of the kernel.

Before you will be able to see any debug logs, you must first enable debug log output using the command `enable-debug-log {enable | disable}` (page 301).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug kernlog show
diagnose debug kernlog clear
```

Related Topic

debug netstatlog

Use this command to record the print information of the `netstat -anlt` when the proxyd program is overloaded.

Before you will be able to see any debug logs, you must first enable debug log output using the command `enable-debug-log {enable | disable}` (page 301).

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug netstatlog show
diagnose debug netstatlog clear
```

Related Topic

- "debug" on page 574

debug reset

Use this command to reset all debug log settings to default settings for the currently installed firmware version. If you have not upgraded or downgraded the firmware, this restores the factory default settings.

To use this command, your administrator account's access control profile requires only `r` permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug reset
```

debug trace report

Use this command to start or stop collecting debug logs.

Only administrators or users with the `prof_admin` access file have permission to this command.

Syntax

```
diagnose trace report {start | stop}
```

Variable	Description	Default
`trace report {start | stop}`	Select whether to enable (`start`) or disable (`stop`) collecting debug logs.	No default

Related topics

- "debug" on page 574

debug trace tcpdump

Use this demand to trace packets with tcpdump.

Syntax

```
diagnose trace tcpdump "<filter_str>" {any | "<interface_str>"} "<max-packet-count_int>"
    {reset}
```

Variable	Description	Default
"<filter_str>"	Specify which protocols and port numbers that you do or do not want to capture, such as 'tcp and port 80 and host IP1 and (IP2 or IP3)', or leave this field blank for no filters. **Note** that please use the same filter expression as tcpdump for this filter, you can refer to the Linux main page of TCPDUMP (http://www.tcpdump.org/manpages/tcpdump.1.html).	No default
{any | "<interface_str>"}	Select the network interface on which you want to capture packets, such as port1, or any for all interfaces.	any
"<max-packet-count_int>"	Specify the maximum packets you want to capture for the policy. Capture will stop automatically if the total captured packets hit the count.	4000
{reset}	Reset all the settings to default.	No default

debug upload

Use this command to upload debug logs to an FTP server. This can be used if you want to view logs outside of the CLI, or if you need to provide debug log files to Fortinet Customer Service & Support:

https://support.fortinet.com

To use this command, your administrator account's access control profile requires only r permission in any profile area. For details, see "Permissions" on page 55.

Syntax

```
diagnose debug upload <ftp_ipv4> <user_str> <password_str> <upload-dir_str>
```

Variable	Description	Default
<ftp_ipv4>	Enter the IP address or domain name of the FTP server.	No default.
<user_str>	Enter a valid user account name to log in to the FTP server.	No default.
<password_str>	Enter the password for the user account.	No default.
<upload-dir_str>	Enter the directory path on the FTP server where FortiWeb will upload files.	No default.

Example

```
diagnose debug upload 192.0.2.5 user1 1passw0Rd C:/uploads
```

Related topics

- "debug" on page 574

hardware check

Use this command to check the appliance hardware for errors. In the case of FortiWeb, this command checks virtual hardware—the vCPUs.

For example, to troubleshoot a logging problem, use the following command to check the log disk for errors:

```
diagnose hardware check logdisk
```

If the disk does not pass the check, it is likely the source of the problem.

Syntax

```
diagnose hardware check {all |cp8 |cpu |logdisk | memory |nic}
```

Variable	Description	Default
{all |cp8 |cpu |logdisk | memory |nic}	Enter the type of hardware to check, or enter `all` to check all hardware. For FortiWeb-VM versions, the `cp8` option is not available. Note: Only some hardware platforms support `diagnose hardware check`.	No default.

Example

The following command checks the log disk:

```
diagnose hardware check logdisk
```

Output similar to the following appears in the CLI:

```
logdisk check Pass
size Pass 1952
disk-number Pass 2
raid-level Pass raid1
```

hardware cpu

Use this command to display a list of hardware specifications on the FortiWeb appliance for CPUs. In the case of FortiWeb-VM, this command displays virtual hardware information—the vCPUs.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose hardware cpu [list]
```

Example

```
diagnose hardware cpu list
```

Output similar to the following appears in the CLI:

```
processor : 0
vendor_id : GenuineIntel
cpu family : 6
model : 23
model name : Intel(R) Xeon(R) CPU E5405 @ 2.00GHz
stepping : 10
cpu MHz : 1995.056
cache size : 6144 KB
physical id : 0

- "system performance" on page 674

hardware fail-open

Fail-to-wire/bypass behavior is available for specific models only. For details, see "system fail-open" on page 240.

hardware harddisk

Use this command to display a list of hard disks and their capacity in megabytes (MB) in the FortiWeb appliance. In the case of FortiWeb-VM, this will instead be for virtual hardware.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose hardware harddisk [list]
```

Example

```
diagnose hardware harddisk list
```

Output similar to the following appears in the CLI:

```
name size(M)
sda 625.56
sdb 32212.25
```

On a FortiWeb 1000C with a single properly functioning internal hard disk plus its internal flash disk, this command should show two file systems:

```
name size(M)
sda 1000204.89
sdb 1971.32
```

where `sda`, the larger file system, is from the hard disk used to store non-configuration/firmware data. If it does not appear, you can reboot and attempt to run a file system check to fix the file system and mount it.

Similarly FortiWeb 3000D shows:

```
name size(M)
sda 1999844.15
sdb 2055.21
```

hardware interrupts

Use this command to display input/output (I/O) interrupt requests (IRQs) on the FortiWeb appliance. (In the case of FortiWeb-VM, this will instead be for virtual hardware.)

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose hardware interrupts list
```

Example

```
diagnose hardware interrupts list
```

Output similar to the following appears in the CLI:

```
CPU0
0: 225 IO-APIC-edge timer
1: 597 IO-APIC-edge i8042
2: 0 XT-PIC-XT-PIC cascade
12: 6 IO-APIC-edge i8042
14: 0 IO-APIC-edge ide0
15: 0 IO-APIC-edge ide1
16: 151462 IO-APIC-fasteoi vmxnet ether
17: 1080446 IO-APIC-fasteoi ioc0, vmxnet ether
18: 357613 IO-APIC-fasteoi vmxnet ether
19: 150107 IO-APIC-fasteoi vmxnet ether
NMI: 0 Non-maskable interrupts
LOC: 103791489 Local timer interrupts
SPU: 0 Spurious interrupts
PMI: 0 Performance monitoring interrupts
IWI: 0 IRQ work interrupts
RES: 0 Rescheduling interrupts
CAL: 0 Function call interrupts
TLB: 0 TLB shootdowns
MCE: 0 Machine check exceptions
MCP: 346 Machine check polls
ERR: 0
MIS: 0
```

Related topics

- "system performance" on page 674

hardware logdisk info

Use this command to display the capacity, partitions, mount status, and RAID level (if any) of the hard disk FortiWeb uses to store logs and other data. For FortiWeb-VM, information for virtual hardware (the vDisk) is displayed.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose hardware logdisk info
```

Example

This example shows normal output for a FortiWeb-VM installation: there is no RAID, and it has been allocated a 40 GB vDisk. If the disk were mounted as read-only, this would indicate that the disk had failed to mount normally, and would be the cause if no new log messages were being recorded.

```
diagnose hardware logdisk info
```

The CLI displays output that is similar to the following:

```
disk number: 1
disk[0] size: 31.46GB
raid level: no raid exists
partition number: 1
mount status: read-write
```

hardware mem

Use this command to display the usage statistics of ephemeral memory (RAM), including swap pages and shared memory (`Shmem`), on the FortiWeb appliance. In the case of FortiWeb-VM, this will instead be for virtual hardware—the vRAM.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose hardware mem list
```

Example

```
diagnose hardware mem list
```

Output similar to the following appears in the CLI:

```
MemTotal: 1026808 kB
MemFree: 397056 kB

hardware nic

Use this command to display a list of hardware specifications for the network interface card (NIC) physical ports on the FortiWeb appliance. (In the case of FortiWeb-VM, this will instead be for virtual hardware—the vNICs—and therefore the driver will be a virtual driver such as `vmxnet`, and the interrupt will be a virtual IRQ address.)

If the FortiWeb's network hardware has failed, this command can help to detect it. For example, if you know that the network cable is good and the configuration is correct, but this command displays `Link detected: no`), the physical network port may be broken.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose hardware nic list [<interface_name>]
```

Variable	Description	Default

list [<interface_name>]	Optionally, enter the name of a physical network interface, such as `port1`, to display its link status, configuration, hardware information, status, and connectivity statistics such as collision errors.
	If you omit the name of a NIC port, the CLI returns a list of all physical network interfaces, as well as the loopback interface (`lo`):
	`lo`
	`port1`
	`port2`
	`port3`
	`port4`
	Note: The detected physical link status from this command is **not** the same as its configured administrative status.
	For example, even though you have used `config config system interface` (page 281) to configure port1 with `set status down`, if the cable is physically plugged in, `diagnose hardware nic list port1` will indicate correctly that the link is up (`Link detected: yes`).
		No default.

Example

```
diagnose hardware nic list
```

Output similar to the following appears in the CLI:

```
driver vmxnet
version 2.0.9.0
firmware-version N/A
```

```
bus-info 0000:00:11.0

Supported ports TP
Supported link modes 1000baseT/Full
Supports auto-negotiation: No
Advertised link modes: Not reported
Advertised auto-negotiation: No

hardware raid list

Use this command to run a diagnostic test of each hard disk in the RAID array that FortiWeb has. It also displays the capacity and RAID level. Because FortiWeb-VM has no RAID, this command is not applicable to it.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose hardware raid list
```

Example

```
diagnose hardware raid list
```

Output similar to the following (from a FortiWeb 3000D) appears in the CLI window:

```
disk-number size(M) level
0(OK),1(OK), 1877274 raid1
```

index

Use this command to view (`list`) or clear logs, or to examine (`show`) or configure logs.

To use this command, your administrator account's access control profile must have `rw` or `w` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose index all show
diagnose index all clear
diagnose index {alog | dlog | elog | tlog} clear
diagnose index {alog | dlog | elog | tlog} list <index_int>
diagnose index {alog | dlog | elog | tlog} set <queue_int>
```

```
diagnose index {alog | dlog | elog | tlog} show
```

Variable	Description	Default
`index {alog | dlog | elog | tlog}`	Select which log files to view or affect: • `alog`—Attack logs. • `dlog`—Debug logs. • `elog`—Event logs. • `tlog`—Traffic logs.	No default.
`list <index_int>`	Enter the number of most recent logs to display.	No default.
`set <queue_int>`	Enter the maximum length of the log before it is flushed and written to disk. The valid range is 0–32,768.	No default.

Example

This example displays a list of logs processed.

```
diagnose index all show
```

log

Use this command to view (`list`) or clear log messages, or to examine (`show`) or configure logging queues.

To use this command, your administrator account's access control profile must have `rw` or `w` permission to the `loggrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose log {all | alog | dlog | elog | tlog} [show | start | stop]
```

Variable	Description	Default
`log {all | alog | dlog | elog | tlog}`	Select which log files to view: • `all`—All logs	No default.

Variable	Description	Default
	• `alog`—Attack logs • `dlog`—Debug logs • `elog`—Event logs • `tlog`—Traffic logs	
`[show | start | stop]`	Displays the log messages or specifies a time to start or stop logging.	

Example

This example sets a time to start the display of log messages, displays log information starting at that time, and stops the display of log messages. The appliance's responses are displayed in **bold**.

```
FortiWeb # dia log all start
start tracking log
FortiWeb # dia log all show
      time span starts from 2014-07-31 18:31:53.000000
          Total time span is 10.754097 seconds
          Time spent on waiting is 10.527346 seconds
        Time spent on preprocessing is 0.000000 seconds
        event log processed: 0
        traffic log processed: 0
        attack log processed: 0
FortiWeb # dia log all stop
stop tracking log
```

network arp

Use this command to add or delete an address resolution protocol (ARP) table entry, or to display the ARP table. The ARP table is used to resolve the IP addresses that correspond to a network interface card's physical MAC address, thereby determining which IP addresses can be reached directly through a link.

To use this command, your administrator account's access control profile must have `rw` or `w` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose network arp add <interface_name><mac-address_hex>
diagnose network arp delete network arp
```

```
diagnose network arp list
diagnose network arp flush
```

Variable	Description	Default
<interface_name>	Enter the name of the interface to add or delete from the ARP table.	No default.
{<interface_ipv4> | interface_ipv6>}	Enter the IP address of the interface.	No default.
<mac-address_hex>	Enter the MAC address of the interface.	No default.

Example

This example displays a list of ARP table entries.

```
FortiWeb # diagnose network arp list
port_ha: 169.254.0.2 fc:aa:14:75:c0:e0 reachable
port1: 10.0.0.1 00:09:0f:77:11:1d stale
port2: 10.65.13.3 00:0c:29:02:f1:bb reachable
lo: 10::13:101 0: 0: 0: 0: 0: 0 noarp
port2: ff02::16 33:33: 0: 0: 0:16 noarp
vlan66: ff02::16 33:33: 0: 0: 0:16 noarp
port7: ff02::2 33:33: 0: 0: 0: 2 noarp
port_ha: ff02::2 33:33: 0: 0: 0: 2 noarp
port_tn: ff02::16 33:33: 0: 0: 0:16 noarp
port7: ff02::16 33:33: 0: 0: 0:16 noarp
port_ha: ff02::16 33:33: 0: 0: 0:16 noarp
gretap0: ff02::16 33:33: 0: 0: 0:16 noarp
```

network ip

Use these commands to add or delete a network interface, loopback interface, or virtual server (which functions somewhat like a virtual network interface) IP address, or to list the table of network interface IPs.

Back up the configuration before deleting a network interface table entry. FortiWeb presents no confirmation message, and in some cases such as the loopback interface, provides no undelete mechanism.

To use this command, your administrator account's access control profile must have `rw` or `w` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose network ip add <interface_name> {<interface_ipv4> | interface_ipv6} {<interface_
    ipv4mask> |<interface_v6mask>}
diagnose network ip delete <interface_name> {<interface_ipv4> | interface_ipv6}
diagnose network ip list
```

Variable	Description	Default
`<interface_name>`	Enter the name of the interface to add or delete from the network interface table.	No default.
`{<interface_ipv4> | interface_ipv6}`	Enter the IP address of the network interface.	No default.
`{<interface_ ipv4mask> |<interface_ v6mask>}`	Enter the subnet mask.	No default.

Example

This example displays a list of enabled network interfaces, including the loopback (`lo`).

```
FortiWeb # diagnose network ip list
lo: 127.0.0.1/24
port1: 10.200.123.2/16
lo: ::1/128
port1: fe80::20c:29ff:fec3:34a6/64
port5: fe80::20c:29ff:fec3:34ce/64
port9: fe80::20c:29ff:fec3:34f6/64
port2: fe80::20c:29ff:fec3:34b0/64
port6: fe80::20c:29ff:fec3:34d8/64
port10: fe80::20c:29ff:fec3:3400/64
port3: fe80::20c:29ff:fec3:34ba/64
port7: fe80::20c:29ff:fec3:34e2/64
port4: fe80::20c:29ff:fec3:34c4/64
port8: fe80::20c:29ff:fec3:34ec/64
port_tn: fe80::1854:64ff:fe68:fd55/64
```

Example

This example deletes the IP of a virtual server on port2.

```
diagnose network ip delete port1 192.0.2.221
```

Related topics

network route

Use this command to add or delete a route in the routing table, or to list the routing table.

This command displays **all** individual entries, including automatically configured routes for the loopback interface and VLANs, and also displays each route's priority. Unlike `diagnose network rtcache` (page 620), it displays all known routes, regardless of whether they have been recently used.

Do not delete routes unless you are sure. FortiWeb does not ask you to confirm the deletion, and there is no undelete mechanism. For example, if you accidentally delete a loopback interface route, you must recreate it manually.

To use this command, your administrator account's access control profile must have `rw` or `w` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose network route add {<source_ipv4mask> | <source_ipv6mask>} <delay_int>
    {<destination_ipv4mask> | <destination_ipv6mask>} <delay_int> <delay_int><priority_
    int>
diagnose network route delete {<source_ipv4mask> | <source_ipv6mask>} <delay_int>
    {<destination_ipv4mask> | <destination_ipv6mask>} <delay_int> <delay_int> <priority_
    int>
diagnose network route list
```

Variable	Description	Default
`{<source_ipv4mask> | <source_ipv6mask>}`	Enter the IP address and network mask of the source, separated by a space.	No default.
`<interface_name>`	Enter the name of the interface to add or delete from the routing table.	No default.
`{<destination_ipv4mask> | <destination_ipv6mask>}`	Enter the IP address and network mask of the source, separated by a space.	No default.
`{<gateway_ipv4> | <gateway_ipv6>}`	Enter the IP address of the next hop router (sometimes called a gateway) to which this route sends packets.	No default.
`<priority_int>`	Enter the priority of the route in the routing table. The lower the number, the higher the priority. The valid range is 1–255.	`0`

Example

This example displays the routing table.

```
FortiWeb # diagnose network route list
0.0.0.0/0(none)->10.200.0.0/16(port1) via 0.0.0.0, pri 0 prot 2 scope 253
```

```
::/0(none)->fe80::/64(port1) via ::, pri 256 prot 2 scope 0
::/0(none)->fe80::/64(port2) via ::, pri 256 prot 2 scope 0
::/0(none)->fe80::/64(port3) via ::, pri 256 prot 2 scope 0
::/0(none)->fe80::/64(port4) via ::, pri 256 prot 2 scope 0
::/0(none)->fe80::/64(port5) via ::, pri 256 prot 2 scope 0
::/0(none)->fe80::/64(port6) via ::, pri 256 prot 2 scope 0
::/0(none)->fe80::/64(port7) via ::, pri 256 prot 2 scope 0
::/0(none)->fe80::/64(port8) via ::, pri 256 prot 2 scope 0
::/0(none)->fe80::/64(port9) via ::, pri 256 prot 2 scope 0
::/0(none)->fe80::/64(port10) via ::, pri 256 prot 2 scope 0
::/0(none)->fe80::/64(port_tn) via ::, pri 256 prot 2 scope 0
```

Example

This example adds a route to the routing table.

```
diagnose network route add 10::/64 port1 10:200::1/64 port1 10::1 0
```

- "network rtcache" on page 620
- "router static" on page 110

network rtcache

Use this command to display the routing cache.

Unlike `diagnose network route` (page 619), this command displays the cache of the most recently used routes, **not** necessarily the entire configuration. (You may have configured many routes, and these configurations will be saved to disk and appear in `diagnose network route` (page 619), but rarely used ones will **not** usually appear in the route cache, which keeps recently used routes in RAM for performance reasons.)

To use this command, your administrator account's access control profile must have `rw` or `w` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose network rtcache list
```

Example

This example displays the ARP cache.

```
172.20.120.52(port1)->255.255.255.255(lo) via 0.0.0.0, pri 0 prot 0 scope 0, ref 0 lastuse

network sniffer

Use this command to perform a packet trace on one or more network interfaces.

Packet capture, also known as sniffing or packet analysis, records some or all of the packets seen by a network interface (that is, the network interface is used in promiscuous mode). By recording packets, you can trace connection states to the exact point at which they fail, which may help you to diagnose some types of problems that are otherwise difficult to detect.

FortiWeb appliances have a built-in sniffer. Packet capture on FortiWeb appliances is similar to that of FortiGate appliances. Packet capture output appears on your CLI display until you stop it by pressing Ctrl+C, or until it reaches the number of packets that you have specified to capture.

Packet capture can be very resource intensive. To minimize the performance impact on your FortiWeb appliance, use packet capture only during periods of minimal traffic, with a local console CLI connection rather than a Telnet or SSH CLI connection, and be sure to stop the command when you are finished.

If your FortiWeb model uses Data Plane Development Kit (DPDK) for packet processing (for example, models 3000E, 3010E and 4000E) and is operating in Offline Protection mode, you cannot use this command with ports that are configured as data capture ports. To use the command with this type of port, disable the corresponding server policy or configure the policy with a different data capture port.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose network sniffer [{any | "<interface_name>"} [{none | "<filter_str>"} [{1 | 2 | 3} [<packets_int>]]]]
```

Variable	Description	Default
`{any | "<interface_name>"}`	Enter the name of a network interface whose packets you want to capture, such as `port1`, or type `any` to capture packets on all network interfaces. If you omit this and the following parameters for the command, the command captures all packets on all network interfaces.	No default.

`{none | "<filter_str>"}`	Enter either `none` to capture all packets, or type a filter that specifies which protocols and port numbers that you do or do not want to capture, such as `"tcp port 25"`.
	Filters use tcpdump (http://www.tcpdump.org) syntax:
	`"[[src|dst] host {<host1_fqdn> | <host1_ipv4>}] [and|or] [[src|dst] host {<host2_fqdn> | <host2_ipv4>}] [and|or] [[arp|ip|gre|esp|udp|tcp] port <port1_int>] [and|or] [[arp|ip|gre|esp|udp|tcp] port <port2_int>]"`
	To display only the traffic between two hosts, specify the IP addresses of both hosts. To display only forward or reply packets, indicate which host is the source, and which is the destination.
	For example, to display UDP `port 1812` traffic between `1.example.com` and either `2.example.com` or `3.example.com`, you would enter:
	`"udp and port 1812 and src host`
		`none`

Variable	Description	Default
	`1.example.com and dst \( 2.example.com or 2.example.com \)"`	
`{1 | 2 | 3}`	Type one of the following integers indicating the depth of packet headers and payloads to capture: • `1`—Display the packet capture timestamp, plus basic fields of the IP header: the source IP address, the destination IP address, protocol name, and destination port number. Does **not** display all fields of the IP header; it omits: • IP version number bits • Internet header length (`ihl`) • type of service/differentiated services code point (`tos`) • explicit congestion notification • total packet or fragment length • packet ID • IP header checksum • time to live (`TTL`) • fragment offset • options bits • `2`—All of the output from `1`, plus the packet payload in both hexadecimal and ASCII. • `3`—All of the output from `2`, plus the link layer (Ethernet) header. For troubleshooting purposes, Fortinet Technical Support may request the most verbose level (`3`).	`1`
`<packets_int>`	Enter the number of packets to capture before stopping. If you do not specify a number, the command will continue to capture packets until you press Ctrl+C.	Packet capture continues until you press Ctrl + C.

Example

The following example captures three packets of traffic from any port number or protocol and between any source and destination (a filter of `none`), which passes through the network interface named `port1`. The capture uses a low level of verbosity (indicated by `1`).

Commands that you would type are highlighted in bold; responses from the FortiWeb appliance are not bolded.

```
FortiWeb# diagnose network sniffer port1 none 1 3
filters=[none]
0.918957 192.168.0.1.36701 -> 192.168.0.2.22: ack 2598697710
0.919024 192.168.0.2.22 -> 192.168.0.1.36701: psh 2598697710 ack 2587945850
```

```
0.919061 192.168.0.2.22 -> 192.168.0.1.36701: psh 2598697826 ack 2587945850
```

If you are familiar with the TCP protocol, you may notice that the packets are from the middle of a TCP connection. Because `port 22` is used (highlighted above in bold), which is the standard port number for SSH, the packets might be from an SSH session.

Example

The following example captures packets traffic on TCP `port 80` (typically HTTP) between two hosts, `192.168.0.1` and `192.168.0.2`. The capture uses a low level of verbosity (indicated by `1`). Because the filter does not specify either host as the source or destination in the IP header (`src` or `dst`), the sniffer captures both forward and reply traffic.

Commands that you would type are highlighted in bold; responses from the FortiWeb appliance are not bolded.

```
FortiWeb# diagnose network sniffer packet port1 'host 192.168.0.2 or host 192.168.0.1 and
    tcp port 80' 1
```

A specific number of packets to capture is not specified. As a result, the packet capture continues until the administrator presses Ctrl+C. The sniffer then confirms that five packets were seen by that network interface. Below is a sample output.

```
192.168.0.2.3625 -> 192.168.0.1.80: syn 2057246590
192.168.0.1.80 -> 192.168.0.2.3625: syn 3291168205 ack 2057246591
192.168.0.2.3625 -> 192.168.0.1.80: ack 3291168206
192.168.0.2.3625 -> 192.168.0.1.80: psh 2057246591 ack 3291168206
192.168.0.1.80 -> 192.168.0.2.3625: ack 2057247265
5 packets received by filter
0 packets dropped by kernel
```

Example

The following example captures TCP `port 443` (typically HTTPS) traffic occurring through port1, regardless of its source or destination IP address. The capture uses a high level of verbosity (indicated by `3`).

The number of packets to capture is not specified, so the packet capture continues until the administrator presses Ctrl+C. The sniffer then states how many packets were seen by that network interface.

Verbose output can be very long. As a result, output shown below is truncated after only one packet.

Commands that you would type are highlighted in bold; responses from the FortiWeb appliance are not bolded.

```
FortiWeb# diagnose network sniffer packet port1 'tcp port 443' 3
interfaces=[port1]
filters=[tcp port 443]
10.651905 192.168.0.1.50242 -> 192.168.0.2.443: syn 761714898

```

Instead of reading packet capture output directly in your CLI display, you usually should save the output to a plain text file using your CLI client. Saving the output provides several advantages. Packets can arrive more rapidly than you may be able to read them in the buffer of your CLI display, and many protocols transfer data using encodings other than US-ASCII. It is often, but not always, preferable to analyze the output by loading it into in a network protocol analyzer application such as Wireshark (http://www.wireshark.org/).

For example, you could use PuTTY or Microsoft HyperTerminal to save the sniffer output to a file. Methods may vary. See the documentation for your CLI client.

Requirements

- Terminal emulation software such as PuTTY (http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html)
- A plain text editor such as Notepad
- A Perl interpreter
- Network protocol analyzer software such as Wireshark (http://www.wireshark.org)

To view packet capture output using PuTTY and Wireshark

1. On your management computer, start PuTTY.
2. Use PuTTY to connect to the FortiWeb appliance using either a local console, SSH, or Telnet connection. For details, see "Connecting to the CLI" on page 43.
3. Type the packet capture command, such as:

   ```
   diag network sniffer packet port1 'tcp port 443' 3 100
   ```

   but do **not** press Enter yet.
4. In the upper left corner of the window, click the PuTTY icon to open its drop-down menu, then select **Change Settings**.
5. In the **Category** tree on the left, go to **Session > Logging.**
6. Select **Printable output**.
7. In **Log file name**, click the **Browse** button, then choose a directory path and file name such as `C:\Users\MyAccount\packet_capture.txt` to save the packet capture to a plain text file. You do not need to save it with the `.log` file extension.
8. Click **Apply**.
9. Press Enter to send the CLI command to the FortiMail appliance, beginning packet capture.
10. If you have not specified a number of packets to capture, when you have captured all packets that you want to analyze, press Ctrl + C to stop the capture.
11. Close the PuTTY window.
12. Open the packet capture file using a plain text editor such as Notepad.
13. Delete the first and last lines, which look like this:

    ```
    =~=~=~=~=~=~=~=~=~=~=~=~= PuTTY log 6/3/2021.07.25 11:34:40 =~=~=~=~=~=~=~=~=~=~=~=~=~=
    FortiWeb-2000 #
    ```

    These lines are a PuTTY timestamp and a command prompt, which are not part of the packet capture. If you do not delete them, they could interfere with the script in the next step.
14. Convert the plain text file to a format recognizable by your network protocol analyzer application.

    You can convert the plain text file to a format recognizable by Wireshark (`.pcap`) using the `fgt2eth.pl` Perl script. To download `fgt2eth.pl`, see the Fortinet Knowledge Base article "Using the FortiOS built-in packet sniffer:"

    http://kb.fortinet.com/kb/documentLink.do?externalId=11186

The `fgt2eth.pl` script is provided as-is, without any implied warranty or technical support, and requires that you first install a Perl module compatible with your operating system.

To use fgt2eth.pl, open a command prompt, then enter a command such as the following:

```
fgt2eth.pl -in packet_capture.txt -out packet_capture.pcap
```

where:

- `fgt2eth.pl` is the name of the conversion script; include the path relative to the current directory, which is indicated by the command prompt
- `packet_capture.txt` is the name of the packet capture's output file; include the directory path relative to your current directory
- `packet_capture.pcap` is the name of the conversion script's output file; include the directory path relative to your current directory where you want the converted output to be saved

Methods to open a command prompt vary by operating system.
On Windows XP, go to **Start > Run** and enter `cmd`.
On Windows 7, click the Start (Windows logo) menu to open it, then enter `cmd`.

15. Open the converted file in your network protocol analyzer application. For further instructions, see the documentation for that application.

network tcp list

Use this command to view a list of TCP raw socket details, including:

- `sl`—Kernel socket hash slot.
- `local_address`—IP address and port number pair of the local FortiWeb network interface in hexadecimal, such as `DD01010A:0050`.
- `rem_address`—Remote host's network interface and port number pair. If not connected, this will contain `00000000:0000`.
- `st`—TCP state code (e.g. `OA` for listening, `01` for established, or `06` for timeout wait)
- `tx_queue`—Kernel memory usage by the transmission queue.
- `rx_queue`—Kernel memory usage by the retransmission queues.
- `tr`, `tm-> when`, `retrnsmt`—Kernel socket state debugging information.
- `uid`—User ID of the socket's creator (on FortiWeb, always `0`).
- `timeout`—Connection timeout.
- `inode`—Pseudo-file system i-node of the process.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose network tcp list
```

Example

```
diagnose network tcp list
sl local_address rem_address st tx_queue rx_queue tr tm->when retrnsmt uid timeout inode
0: DD01010A:0050 00000000:0000 0A 00000000:00000000 00:00000000 00000000 0 0 333597 1

network udp list

Use this command to view a list of UDP raw socket details, including:

- `sl`—Kernel socket hash slot.
- `local_address`—IP address and port number pair of the local FortiWeb network interface in hexadecimal, such as `DD01010A:0050`.
- `rem_address`—Remote host's network interface and port number pair. If not connected, this will contain `00000000:0000`.
- `st`—TCP state code in hexadecimal (e.g. `0A` for listening, `01` for connection established, or `06` for waiting for data)
- `tx_queue`—Kernel memory usage by the transmission (Tx) queue.
- `rx_queue`—Kernel memory usage by the retransmission (Rx) queues. This is not used by UDP, since the protocol itself does not support retransmission.

- `tr`, `tm-> when`, `retrnsmt`—Kernel socket state debugging information. These are not used by UDP, since the protocol itself does not support retransmission.
- `uid`—User ID of the socket's creator (on FortiWeb, always `0`).
- `timeout`—Connection timeout.
- `inode`—Pseudo-file system inode of the process.
- `ref`, `pointer`—Pseudo-file system references.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose network udp list
```

Example

```
diagnose network udp list
sl local_address rem_address st tx_queue rx_queue tr tm->when retrnsmt uid timeout inode ref
    pointer drops
307: 00000000:00A1 00000000:0000 07 00000000:00000000 00:00000000 00000000 0 0 2498 2

policy

Use this command to view the process ID, live sessions, and traffic statistics associated with a server policy.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose policy pserver [list "<policy_name>"]
diagnose policy session [list "<policy_name>"]
diagnose policy traffic [list "<policy_name>"]
diagnose policy period-blockip [list "<policy_name>"]
diagnose policy period-blockip [delete "<policy_name>"]{ipv4 | ipv6}
diagnose policy "<policy_name>"
```

Variable	Description	Default
`pserver [list "<policy_name>"]`	Displays the status of physical servers covered by the policy.	No default.
`session [list "<policy_name>"]`	Displays IP session information for TCP and UDP connections.	No default.
`traffic [list "<policy_name>"]`	Displays traffic throughput (bandwidth usage) information.	No default.
`period-blockip [list "<policy_name>"]`	Displays client IP addresses whose requests are temporarily blocked because the client violated a rule in the specified policy with an **Action** value of **Period Block**.	No default.
`period-blockip [delete "<policy_name>"]{ipv4 | ipv6}`	Unblocks the specified client IP address that FortiWeb has blocked because it violated a rule in the specified policy with an **Action** value of **Period Block**. (FortiWeb can still block the address because it violates a rule in a different policy.)	No default.
`"<policy_name>"`	Enter the name of an existing server policy.	No default.

Example

This example shows the output of the `pserver list` command. The `alive` value indicates the status of the server health check:

Integer	Health check status	Health Check Status icon in Policy Status dashboard
0	Failed	Red
1	Passed	Green
2	Disabled	Grey

```
diagnose policy pserver list Policy1
policy(Policy1)
server-pool(FWB_server_pool):
total = 1
server[0]
id: 1
ip: 10.20.1.22
port: 80
alive: 2
session: 0
status: 1
```

system flash

Use this command to change the currently active firmware partition or to display partition information stored on the flash drive.

FortiWeb appliances have 2 partitions that each contain a firmware image: one is the primary and one is the backup. If the FortiWeb appliance is unable to successfully boot using the primary firmware partition, it may boot using the alternative firmware partition. The second partition can contain another version of the firmware.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose system flash default <partition_int>
diagnose system flash list
```

Variable	Description	Default
`<partition_int>`	Enter the number of the partition that will be used as the primary firmware partition during the **next** reboot or startup. The other partition will become the backup firmware partition.	No default.

Example

This example lists the partition settings.

```
diagnose system flash list
```

Below is a sample output.

```
Image# Version TotalSize(KB) Used(KB) Use% Active
1 FV-1KB-4.30-FW-build0521-110120 38733 33125 86% No
2 FV-1KB-4.30-FW-build0522-110112 38733 33125 86% Yes
3 836612 16980 2 % No
```

system ha mac

Use this command to display the virtual MAC addresses and link statuses of each network interface of appliances in the HA group.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose system ha mac
```

Example

This example indicates that the links are “up” (`linkfail=0`) for port1 and port3 on the currently active appliance in the HA pair. While operating in HA, the network interfaces are using a Layer 1 data link (MAC) address that begins with the hexadecimal string `00:09:0F:09:00:`.

```
diagnose system ha mac
```

Below is a sample output.

```
HA mac msg
name=port1, phyindex=0, 00:09:0F:09:00:01, linkfail=0
name=port2, phyindex=1, 00:09:0F:09:00:02, linkfail=1
name=port3, phyindex=2, 00:09:0F:09:00:03, linkfail=0
name=port4, phyindex=3, 00:09:0F:09:00:04, linkfail=1
```

- "system status" on page 675
- system ha

system ha status

Use this command to display the HA group ID, as well as the serial number, role (active or standby), and device priority of each appliance belonging to the HA cluster.

To use this command, your administrator account’s access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose system ha status
```

Example

This example lists the HA group ID, serial numbers, and device priorities.

```
diagnose system ha status
```

Below is a sample output.

```
HA information

Model=FV-1KD-5.30-FW-build0431, Mode=a-p Group=2

HA group member information: is_manage_master=1.
FV-1KD3A13800012, Master, 4, 0, 196417
FV-1KD3A13800091, Slave, 6, 0, 185787
```

In this example, in the information for `FV-1KD3A13800012`, `4` is the priority of the appliance and `0` is the number of ports that have been down.

If the value of the priority or ports down is 100, the parameter is “invalid.” For example, if the appliance has not yet joined the HA cluster.

system ha sync-stat

Use this command to display the status of the high availability (HA) synchronization process.

Syntax

```
diagnose system ha sync-stat
```

Status	Description
`INIT`	Initiation. Last synchronization completed and system is ready and waiting for next synchronization.
`SENDING`	Synchronization is in process; data is sending.
`SUCCESS`	Success in data sending; synchronization is complete.
`SEND_TIMEOUT`	Data sending timeout; synchronization is incomplete.

Example

This example lists the HA synchronization status.

```
diagnose system ha sync-stat
```

Below is a sample output.

```
Image INIT
Config INIT
System INIT
CLI INIT
Signature SUCCESS
GeoDB SUCCESS
AV SUCCESS
IpReputation SUCCESS
HarvestCredentials SUCCESS
```

system kill

Use this command to terminate a process currently running on FortiWeb, or send another signal from the FortiWeb OS to the process.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose system kill <delay_int> <delay_int>
```

Variable	Description	Default
`<signal_int>`	Enter the ID of the signal to send to the process. This in an integer between 1 and 32. Some common signals are: • 1—Varies by the process's interpretation, such as re-read configuration files or re-initialize (hang up; `SIGHUP`). For example, the FortiWeb web UI verifies its configuration files, then restarts gracefully. • 2—Request termination by simulating the pressing of the interrupt keys, such as Ctrl + C (interrupt; `SIGINT`). • 3—Force termination immediately and do a core dump (quit; `SIGQUIT`). • 9—Force termination immediately (kill; `SIGKILL`). • 15—Request termination by inter-process communication (terminate; `SIGTERM`).	No default.
`<pid_int>`	Enter the process ID where the signal is sent to. To list all current process IDs, use `diagnose system top` (page 635).	No default.

Related topics

- "system top " on page 635
- "hardware cpu" on page 607
- "hardware mem" on page 610

system mount

Use this command to display a list of mounted file systems, including their available disk space, disk usage, and mount locations.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose system mount list
```

Example

```
diagnose system mount list
```

Output from a FortiWeb 3000D:

```
Filesystem 1M-blocks Used Available Use% Mounted on
/dev/ram0 97 87 10 89% /
none 4823 0 4823 0% /tmp
none 16077 0 16077 0% /dev/shm
/dev/sdb1 189 45 134 25% /data
/dev/sdb3 961 17 895 1% /home
/dev/sda1 1877275 271 1781644 0% /var/log
```

system top

Use this command to view a list of the most system-intensive processes and to change the refresh rate.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
diagnose system top [<delay_int> [<delay_int>]]
```

Variable	Description	Default
<delay_int>	Enter the process list refresh interval in seconds.	5
<max-lines>	Set the maximum number of top processes to display.	All processes are shown.

Once you execute this command, it continues to run and display in the CLI window until you enter `q` (quit).

While the command is running, you can press `Shift + P` to sort the five columns of data by CPU usage (the default) or `Shift + M` to sort by memory usage.

Example

This example displays a list of the top FortiWeb processes and sets the update interval at 10 seconds.

```
diagnose system top 10
```

Below is a sample output.

```
Run Time: 0 days, 0 hours and 48 minutes
0U, 0S, 100I; 1002T, 496F
xmlproxy 152 S 1.3 4.7
updated 54 S 0.1 0.3
monitord 57 S 0.1 0.3
sys_monito 58 S 0.1 0.3
xmlproxy 56 S 0.0 8.2
alertmail 76 S 0.0 4.6
cli 396 S 0.0 1.2
cli 301 S 0.0 1.2
cmdbsvr 43 S 0.0 1.0
httpsd 147 S 0.0 1.0
cli 403 R 0.0 0.9
data_analy 60 S 0.0 0.6
httpsd 308 S 0.0 0.6
cli 379 S 0.0 0.5
hasync 63 S 0.0 0.4
hatalk 62 S 0.0 0.4
synconf 64 S 0.0 0.4
al_daemon 59 S 0.0 0.3
miglogd 53 S 0.0 0.3
```

The first line indicates the up time. The second line lists the processor and memory usage, where the parameters from left to right mean:

- U—Percent of user CPU usage (in this case 0%)
- S—Percent of system CPU usage (in this case 0%)
- I—Percentage of CPU idle (in this case 100%)
- T—Total memory in kilobytes (in this case 2008 KB)
- F—Available memory in kilobytes (in this case 445 KB)

The five columns of data provide the process name (such as `updated`), the process ID (`pid`), the running status, the CPU usage, and the memory usage. The status values are:

- S—Sleeping (idle)
- R—Running
- Z—Zombie (crashed)
- <—High priority
- N—Low priority

system update info

Use this command to display recent error messages and the following information about FortiGuard signatures, IP lists, and engine packages and the geography-to-IP mapping database:

- Current version
- Time of last update
- Next scheduled update time
- Previous version history

Syntax

```
diagnose system update info
```

Example

```
FortiWeb signature
----------

```

execute

The `execute` command has an immediate and decisive effect on your FortiWeb appliance and, for that reason, should be used with care. Unlike `config` commands, most `execute` commands do not result in any configuration change.

This section describes the following commands:

```
backup cert-config
backup cli-config
backup full-config
backup web-protection-profile
batch
certificate ca
certificate crl
certificate inter-ca
certificate local
create-raid level
create-raid rebuild
date
db rebuild
erase-disk
factoryreset
factoryreset
formatlogdisk
ha disconnect
ha manage
ha md5sum
ha synchronize
ping
ping6
ping-options
ping6-options
reboot
remove vmlicense
restore config
restore image
restore secondary-image
restore vmlicense
session-cleanup
shutdown
telnet
telnettest
time
traceroute
update-now
```

backup cert-config

Use this command to back up certificates of a FortiWeb appliance to a TFTP server.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute backup cer-config <filename_str>  <tftp_ipv4> [<password_str>]
```

Variable	Description	Default
`<filename_str>`	Enter the name of the file to be used for the backup file, such as `FortiWeb_backup.zip`.	No default.
`<tftp_ipv4>`	Enter the IP address of the TFTP server.	No default.

Variable	Description	Default
[<password_str>]	Enter a password to be used when decompressing the backup file. **Caution:** Remember the password or keep it in a secure location. You will be required to enter the same password when restoring an encrypted backup file. If you forget or lose the password, you won't be able to use that encrypted backup file.	No default.

Example

This example backs up certificates of the FortiWeb appliance on a TFTP server at IP address `192.0.2.23`. The file is encrypted with the password `P@ssword1`.

```
execute backup cert-config tftp FortiWeb_backup.zip 192.0.2.23 P@ssword1
```

Related topics

- "backup cli-config" on page 641
- "backup full-config" on page 642
- "system backup" on page 208

backup cli-config

Use this command to manually back up the configuration file to a TFTP server.

This method does **not** include uploaded files such as:

- Error pages
- WSDL files
- W3C Schema
- Vulnerability scan settings

If your configuration has these files, use either a full TFTP or FTP/SFTP backup instead. For details, see "backup full-config" on page 642 or "system backup" on page 208.

This command also does **not** include settings that remain at their default values for the currently installed version of the firmware. If you require a backup that includes those settings, instead use `execute backup full-config` (page 642).

Alternatively, you can back up the configuration to an FTP or SFTP server. For details, see "system backup" on page 208.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute backup cli-config tftp <filename_str>  <tftp_ipv4> [<password_str>]
```

Variable	Description	Default
<filename_str>	Enter the name of the file to be used for the backup file, such as FortiWeb_backup.conf.	No default.
<tftp_ipv4>	Enter the IP address of the TFTP server.	No default.
[<password_str>]	Enter a password to be used when encrypting the backup file to a .zip extension file. If you don't provide a password, the backup file will be stored as a clear file with a .zip extension. **Caution:** Remember the password or keep it in a secure location. You will be required to enter the same password when restoring an encrypted backup file. If you forget or lose the password, you won't be able to use that encrypted backup file.	No default.

Example

This example uploads the FortiWeb appliance's system configuration to a file named fweb.zip on a TFTP server at IP address 192.0.2.23. The file will not be password-encrypted.

```
execute backup cli-config tftp fweb.zip 192.0.2.23
```

Related topics

- "backup full-config" on page 642
- "restore config" on page 662
- "system backup" on page 208

backup full-config

Use this command to manually back up the entire configuration file, **including** those settings that remain at their default values, to a TFTP server.

We strongly recommend that you password-encrypt this backup and store it in a secure location. This backup method includes sensitive data such as your HTTPS certificates' private keys. Unauthorized access to private keys compromises the security of all HTTPS requests using those certificates.

Alternatively, you can back up the configuration to an FTP or SFTP server. For details, see "system backup" on page 208.

This backup includes settings that remain at their default values increases the file size of the backup, but may be useful in some cases, such as when you want to compare the default settings with settings that you have configured.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute backup full-config tftp <filename_str>  <tftp_ipv4> [<password_str>]
```

Variable	Description	Default
`<filename_str>`	Enter the name of the file to be used for the backup file, such as `FortiWeb_backup.conf`.	No default.
`<tftp_ipv4>`	Enter the IP address of the TFTP server.	No default.
`[<password_str>]`	Enter a password to be used when encrypting the backup file to a `.zip` extension file. If you don't provide a password, the backup file will be stored as a clear file with a `.zip` extension. **Caution:** Remember the password or keep it in a secure location. You will be required to enter the same password when restoring an encrypted backup file. If you forget or lose the password, you will not be able to use that encrypted backup file.	No default.

Example

This example uploads the FortiWeb appliance's entire configuration, including uploaded error page and HTTPS certificate files, to a file named `fweb.zip` on a TFTP server at IP address `192.0.2.23`. The file is encrypted with the password `P@ssword1`.

```
execute backup full-config tftp fweb.zip 192.0.2.23 P@ssword1
```

Related topics

- "backup cli-config" on page 641
- "system backup" on page 208

backup web-protection-profile

Use this command to back up web protection profiles of a FortiWeb appliance to a TFTP server.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute backup web-protection-profile <filename_str> <tftp_ipv4>[<password_str>]
```

Variable	Description	Default
`<filename_str>`	Enter the name of the backup file, such as `config.zip`.	No default.
`<tftp_ipv4>`	Enter the IP address of the TFTP server.	No default.
`[<password_str>]`	Enter a password to be used when encrypting the backup `.zip` extension file. This is optional. If you don't provide a password, the backup file will be stored as a clear file with a `.zip` extension. **Caution:** Remember the password or keep it in a secure location. You will be required to enter the same password when restoring an encrypted backup file. If you forget or lose the password, you won't be able to use that encrypted backup file.	No default.

Example

This example backs up web protection profiles of the FortiWeb appliance on a TFTP server at IP address `192.0.2.23`. The file is encrypted with the password `P@ssword1`.

```
execute backup web-protection-profile tftp config.zip 192.0.2.23 P@ssword1
```

Related topics

- "system backup" on page 208

batch

Use this command to execute commands in a group. If a command in the group fails or an operation cannot be completed, every command in the group can be rolled back, whether they were successful or not.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute batch start
execute batch status
execute batch lastlog
```

```
execute batch recover
execute batch end
```

Variable	Description	Default
`start`	Enter to initiate batch mode. Every subsequent command will be grouped until you enter the `execute batch end` command.	No default.

`status`	Enter to determine whether batch mode is running. If batch mode is running, you will see this message:
	`Batch mode is running...`
	If batch mode is not running, you will see this command:
	`Batch mode is stopped...`
		No default.

`lastlog`	Enter to view the executed commands in the current batch mode.	No default.
`recover`	Enter to rollback every command that has been executed in the current batch mode.	No default.
`end`	Enter to turn off batch mode.	No default.

create-raid level

Use the this command to initialize the RAID.

Currently, only RAID level 1 is supported, and only on FortiWeb 1000B/C/D/E, 2000E, 3000C/CFsx, 3000E, and 4000E shipped with FortiWeb 4.0 MR1 or later.

On older appliances that have been upgraded to FortiWeb 4.0 MR1, RAID cannot be activated.

Back up any data before initializing the array.

Back up the data regularly. RAID is not a substitute for regular backups. RAID 1 (mirroring) is designed to improve hardware fault tolerance, but cannot negate all risks.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute create-raid level {raid1}
```

Variable	Description	Default
`level {raid1}`	Enter the RAID level. Currently, only RAID level 1 is supported.	`raid1`

Related topics

- "system raid" on page 295
- "hardware raid list" on page 614
- "create-raid rebuild" on page 646

create-raid rebuild

Use the this command to rebuild the RAID.

Currently, only RAID level 1 is supported, and only on FortiWeb-1000B, 1000C, 3000C/CFsx, 3000E, and 4000E shipped with FortiWeb 4.0 MR1 or later.

On older appliances that have been upgraded to FortiWeb 4.0 MR1, RAID cannot be activated.

Back up the data regularly. RAID is not a substitute for regular backups. RAID 1 (mirroring) is designed to improve hardware fault tolerance, but cannot negate all risks.

Rebuilding the array due to disk failure may result in some loss of packet log data.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute create-raid rebuild
```

Example

This example rebuilds the RAID array.

```
execute create-raid rebuild
```

The CLI displays the following:

```
This operation will clear all data on disk :0!
Do you want to continue? (y/n)
```

After you enter `y` (yes), the CLI displays additional messages.

Related topics

- "system raid" on page 295
- "hardware raid list" on page 614

date

Use this command to display or set the system date.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute date <date_str>
```

Variable	Description	Default
`date <date_str>`	Enter the current date for the FortiWeb appliance's time zone, using the format `yyyy-mm-dd`, where: • `yyyy` is the year. Valid years are `2001` to `2037`. • `mm` is the month. Valid months are `01` to `12`. • `dd` is the day of the month. Valid days are `01` to `31`. If you do not specify a date, the command returns the current system date. Shortened values, such as `06` instead of `2006` for the year or `1` instead of `01` for the month or day, are not valid.	No default.

Example

This example sets the date to September 23, 2017:

```
execute date 2017-09-23
```

Related topics

- "time" on page 669

db rebuild

Use this command to rebuild the FortiWeb appliance's internal database that it uses to store log messages.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute db rebuild
```

Related topics

- "formatlogdisk" on page 649
- "debug application miglogd" on page 584
- "debug upload" on page 605

erase-disk

Use this command to erase the hard disk or flash memory.

This command requires a console connection to the appliance and is available only when Federal Information Processing Standards (FIPS) and Common Criteria (CC) compliant mode is enabled. For details, see "system fips-cc" on page 244.

Syntax

```
execute erase-disk { flash | disk } [<erase-times> ]
```

Variable	Description	Default
`{ flash | disk }`	Specify whether to erase the flash memory or the hard disk.	No default.
`<erase-times>`	Enter the number of times to overwrite the specified memory with random data. The valid range is 1–35.	`1`

factoryreset

Use this command to reset the FortiWeb appliance to its default settings for the currently installed firmware version. If you have not upgraded or downgraded the firmware, this restores factory default settings.

Back up your configuration first. This command resets all changes that you have made to the FortiWeb appliance's configuration file and reverts the system to the default values for the firmware version. Depending on the firmware version, this could include factory default settings for the IP addresses of network interfaces. For details about creating a backup, see "backup cli-config" on page 641.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute factoryreset
```

Related topics

- "backup cli-config" on page 641
- "backup full-config" on page 642
- "restore config" on page 662

formatlogdisk

Use this command to clear the logs from the FortiWeb appliance's hard disk and reformat the disk.

This operation deletes all locally stored log files.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

When you execute this command, the FortiWeb appliance displays the following message:

```
This operation will clear all data on the log disk and take a few minutes according to the
    disk size!!
Do you want to continue? (y/n)
```

Syntax

```
execute formatlogdisk
```

Related topics

- "db rebuild" on page 647

ha disconnect

Use this command to manually force a FortiWeb appliance to leave the HA group, **without** unplugging any cables. This can be useful, for example, if you need to remove a standby appliance from the HA cluster in order to configure it for standalone operation, and want to do so **without** disrupting traffic, and without unplugging cables.

Behavior varies by which appliance you eject:

- **Active**—Failover occurs. The standby remains as a member of the HA group, and will elect itself as the new active appliance, assuming all of the HA cluster's configured IP addresses and traffic processing duties.
- **Standby**—No failover occurs. The active appliance remains actively processing traffic.

To ensure that you can re-connect to the ejected appliance's GUI or CLI via a remote network connection (not only via its local console), this command requires that you specify an IP address and port name that will become its new management interface. By default, it will be accessible via HTTP, HTTPS, SSH, and telnet.

All other network interfaces on the ejected appliance will be brought down and reset to 0.0.0.0/0.0.0.0. To configure them, you must connect to the ejected appliance's GUI or CLI.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute ha disconnect <serial-number_str> <interface_name> <interface_ipv4mask/ipv6mask>
```

Variable	Description	Default
`disconnect <serial-number_str>`	Enter the serial number of the FortiWeb appliance that you want to disconnect from the cluster. To display the serial number of each appliance in the HA group, enter: `execute ha disconnect ?`	No default.
`<interface_name>`	Enter the name of the network interface, such as `port1`, that will be configured as the ejected appliance's management interface.	No default.
`<interface_ipv4mask/ipv6mask>`	Enter the IP address and netmask that will be configured as the ejected appliance's management interface.	No default.

Example

This example ejects the standby appliance whose serial number is FV-1KC3R11111111, assigning its port1 to be the web UI interface, reachable at `192.0.2.123`.

```
execute ha disconnect FV-1KC3R11111111 port1 192.0.2.123/24 192::2:123/64
```

After the command completes, to reconfigure the ejected appliance, you could then use either a web browser or SSH client to connect to `192.0.2.123` in order to reconfigure it for standalone operation.

Related topics

- "ha disconnect" on page 649
- "ha manage" on page 651
- "ha md5sum" on page 652

- "system ha mac" on page 631
- "system status" on page 675

ha manage

Use this command to log in to another appliance in the HA group via the HA link. In most cases, you log into a standby appliance (also called the secondary, or slave) from the main (primary or master) appliance, but you can also use a standby appliance to access the main appliance.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute ha manage <cluster-index>
```

Variable	Description	Default
`<cluster-index>`	Enter an index value that the FortiWeb HA feature assigns to a cluster member based on its serial number. The cluster member with the highest serial number has a cluster index of 0, the one with the second-highest serial number has a cluster index of 1, and so on. To display the index numbers of the cluster members, enter: `execute ha manage ?`	No default.

Example

In this example, you are logged in to the main appliance.

```
execute ha manage ?
<id>    please input peer box index.
<2>     Subsidary unit FV-1KD3A12345678
<3>     Subsidary unit FV-1KD3A11345678
```

The cluster index and serial number of the appliance you are currently logged in to is not displayed.

Enter `3` to connect to the standby appliance with serial number FV-1KD3A11345678. The CLI prompt changes to the host name of this unit and the login prompt is displayed.

To return to the primary unit, enter `exit`.

- "system ha mac" on page 631

ha md5sum

Use this command to retrieve the CLI system configuration MD5 from the appliances in an HA cluster.

This information allows you to confirm whether the HA configuration is synchronized.

Syntax

```
execute ha md5sum
```

Example

Below is a sample output.

```
FortiWeb # execute ha md5sum
FV-1KD3A15800048<Master>
   SYS: A4BA318B0762E202B4CAE44173F08CB5
   CLI: 408268C68309651DC4C9D8C094B1EF0F
FV-1KD3A14800059<Slave>
   SYS: A4BA318B0762E202B4CAE44173F08CB5
   CLI: 408268C68309651DC4C9D8C094B1EF0F
```

Related topics

- "ha disconnect" on page 649
- "ha manage" on page 651

ha synchronize

Use this command to manually control the synchronization of configuration files and FortiGuard service-related packages from the active HA appliance to the standby appliance.

Typically, most HA synchronization happens automatically, whenever changes are made. However, in some cases, you may want to use this command to manually initiate full or partial HA synchronization, including to

- Delay synchronization to a more convenient time if you are planning to make large batch changes, and therefore delayed synchronization is preferable for network performance reasons
- Manually force synchronization of files that are not automatically synchronized
- Trigger automatic synchronization if it has been interrupted due to HA link failure, daemon crashes, etc.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute ha synchronize {all | avupd | cli | geodb | sys}
```

Variable	Description	Default
`synchronize {all | avupd | cli | geodb | sys}`	Select which part of the configuration and/or FortiGuard service-related packages to synchronize. • `all`—Entire configuration, including CLI configuration, system files, and signature databases. • `avupd`—Only the FortiGuard Antivirus service package, including the virus signatures, scan engine, and proxy. • `cli`—Only the core CLI configuration file (fwb_system.conf). You can use the `show` command to view the contents of the configuration file. • `geodb`—Only the geography-to-IP address mappings. Similar to firmware, these can be downloaded from the Fortinet Customer Service & Support website: https://support.fortinet.com • `sys`—Only the IP Reputation Database (IRDB) and system files such as X.509 certificates. **Note:** This command has no effect if you use the command `execute ha synchronize stop` to pause it manually.	No default.

Example

This example shows how to manually synchronize the virus signature and engine package to the standby appliance.

```
FortiWeb # execute ha synchronize avupd
starting synchronize with HA master...
```

ping

Use this command to perform an ICMP `ECHO` request (also called a ping) to a host by specifying its fully qualified domain name (FQDN) or IPv4 address, using the options configured by ping-options.

Pings are often used to test IP-layer connectivity during troubleshooting.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute ping {<host_fqdn> | <host_ipv4>}
```

Variable	Description	Default
`ping {<host_fqdn> | <host_ipv4>}`	Type either the IPv4 address or fully qualified domain name (FQDN) of the host.	No default.

Example

This example pings a host with the IP address `192.0.2.10`.

```
execute ping 192.0.2.10
```

The CLI displays the following:

```
PING 192.0.2.10 (192.0.2.10): 56 data bytes
    64 bytes from 192.0.2.10: icmp_seq=0 ttl=128 time=0.5 ms
    64 bytes from 192.0.2.10: icmp_seq=1 ttl=128 time=0.2 ms
    64 bytes from 192.0.2.10: icmp_seq=2 ttl=128 time=0.2 ms
    64 bytes from 192.0.2.10: icmp_seq=3 ttl=128 time=0.2 ms
    64 bytes from 192.0.2.10: icmp_seq=4 ttl=128 time=0.2 ms
--- 192.0.2.10 ping statistics ---
    5 packets transmitted, 5 packets received, 0% packet loss
    round-trip min/avg/max = 0.2/0.2/0.5 ms
```

The results indicate that a route exists between the FortiWeb appliance and `192.0.2.10`. It also indicates that during the sample period, there was no packet loss, and the average response time was 0.2 milliseconds.

Example

This example pings a host with the IP address `192.0.2.78`.

```
execute ping 192.0.2.78
```

The CLI displays the following:

```
PING 192.0.2.78 (192.0.2.78): 56 data bytes
```

After several seconds, no output appears. The administrator halts the ping by pressing Ctrl+C. The CLI displays the following:

```
--- 192.0.2.78 ping statistics ---
5 packets transmitted, 0 packets received, 100% packet loss
```

The results indicate the host may be down, or there is no route between the FortiWeb appliance and `192.0.2.78`. To determine the point of failure along the route, further diagnostic tests are required, such as `execute traceroute` (page 670).

ping6

Use this command to perform an ICMP `ECHO` request (also called a ping) to a host by specifying its IPv6 address, using the options configured in `execute ping-options` (page 656).

Pings are often used to test IP-layer connectivity during troubleshooting.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute ping6 {<host_fqdn> | <host_ipv6>}
```

Variable	Description	Default
`ping6 {<host_fqdn> | <host_ipv6>}`	Enter either the IP address or fully qualified domain name (FQDN) of the host.	No default.

Example

This example pings a host with the IP address `2001:0db8:85a3:::8a2e:0370:7334`.

```
execute ping6 2607:f0b0:f:420::
```

The CLI displays the following:

```
PING 2607:f0b0:f:420:: (2607:f0b0:f:420::): 56 data bytes
```

After several seconds, no output appears. The administrator halts the ping by pressing Ctrl+C. The CLI displays the following:

```
--- 2607:f0b0:f:420:: ping statistics ---
5 packets transmitted, 0 packets received, 100% packet loss
```

The results indicate the host may be down, or there is no route between the FortiWeb appliance and `2607:f0b0:f:420::`. To determine the point of failure along the route, further diagnostic tests are required, such as `execute traceroute` (page 670).

ping-options

Use these commands to configure the behavior of the `execute ping` (page 653) command.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute ping-options data-size <bytes_int>
execute ping-options df-bit {yes | no}
execute ping-options pattern <bufferpattern_hex>
execute ping-options repeat-count <repeat_int>
execute ping-options source {auto | <interface_ipv4>}
execute ping-options timeout <seconds_int>
execute ping-options tos {<service_type>}
execute ping-options ttl <hops_int>
execute ping-options validate-reply {yes | no}
execute ping-options view-settings
```

Variable	Description	Default
`data-size <bytes_int>`	Enter datagram size in bytes.This allows you to send out packets of different sizes for testing the effect of packet size on the connection. If you want to configure the pattern that will be used to buffer small datagrams to reach this size, also configure `pattern <bufferpattern_hex>` (page 657).	`56`
`df-bit {yes | no}`	Enter either `yes` to set the DF bit in the IP header to prevent the ICMP packet from being fragmented, or enter `no` to	`no`

Variable	Description	Default
	allow the ICMP packet to be fragmented.	
`pattern <bufferpattern_hex>`	Enter a hexadecimal pattern, such as `00ffaabb`, to fill the optional data buffer at the end of the ICMP packet. The size of the buffer is determined by `data-size <bytes_int>` (page 656).	No default.
`repeat-count <repeat_int>`	Enter the number of times to repeat the ping.	`5`
`source {auto | <interface_ipv4>}`	Select the network interface from which the ping is sent. Enter either `auto` or a FortiWeb network interface IP address.	auto
`timeout <seconds_int>`	Enter the ping response timeout in seconds.	`2`
`tos {<service_type>}`	Enter the IP type-of-service option value, either: • `default`—Do not indicate. That is, set the TOS byte to 0. • `lowcost`—Minimize cost. • `lowdelay`—Minimize delay. • `reliability`—Maximize reliability. • `throughput`—Maximize throughput.	`default`
`ttl <hops_int>`	Enter the time-to-live (TTL) value.	`64`
`validate-reply {yes | no}`	Select whether or not to validate ping replies.	`no`
`view-settings`	Display the current ping option settings.	No default.

Example

This example sets the number of pings to three and the source IP address to `192.0.2.1`, then views the ping options to verify their configuration.

```
execute ping-option repeat-count 3
execute ping-option source 192.0.2.1
execute ping-option view-settings
```

The CLI would display the following:

```
Ping Options:
Repeat Count: 3
Data Size: 56
Timeout: 2
TTL: 64
TOS: 0
DF bit: unset
Source Address: 192.0.2.1
```

```
Pattern:
Pattern Size in Bytes: 0
Validate Reply: no
```

Related topics

ping6-options

Use these commands to configure the behavior of the `execute ping6` (page 655) command.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute ping6-options data-size <bytes_int>
execute ping6-options pattern <bufferpattern_hex>
execute ping6-options repeat-count <repeat_int>
execute ping6-options source {auto | <interface_ipv6>}
execute ping6-options timeout <seconds_int>
execute ping6-options tos {<service_type>}
execute ping6-options ttl <hops_int>
execute ping6-options validate-reply {yes | no}
execute ping6-options view-settings
```

Variable	Description	Default
`data-size <bytes_int>`	Enter datagram size in bytes. This allows you to send out packets of different sizes for testing the effect of packet size on the connection. If you want to configure the pattern that will be used to buffer small datagrams to reach this size, also configure `pattern <bufferpattern_hex>` (page 657).	`56`
`pattern <bufferpattern_hex>`	Enter a hexadecimal pattern, such as `00ffaabb`, to fill the optional data buffer at the end of the ICMP packet. The size of the buffer is determined by `data-size <bytes_int>` (page 656).	No default.
`repeat-count <repeat_int>`	Enter the number of times to repeat the ping.	`5`
`source {auto | <interface_ipv6>}`	Select the network interface from which the ping is sent. Enter either `auto` or a FortiWeb network interface IP address.	`auto`

Variable	Description	Default
`timeout <seconds_int>`	Enter the ping response timeout in seconds.	`2`
`tos {<service_type>}`	Enter the IP type-of-service option value, either: • `default`—Do not indicate. That is, set the TOS byte to 0. • `lowcost`—Minimize cost. • `lowdelay`—Minimize delay. • `reliability`—Maximize reliability. • `throughput`—Maximize throughput.	`default`
`ttl <hops_int>`	Enter the time-to-live (TTL) value.	`64`
`validate-reply {yes | no}`	Select whether or not to validate ping replies.	`no`
`view-settings`	Display the current ping option settings.	No default.

Example

This example sets the number of pings to `3`, then views the ping options to verify their configuration.

```
execute ping6-option repeat-count 3
execute ping6-option view-settings
```

The CLI would display the following:

```
IPV6 Ping Options:
Repeat Count: 3
Data Size: 56
Timeout: 2
Interval: 1
TTL: 64
TOS: 0
Source Address: auto
Pattern:
Pattern Size in Bytes: 0
Validate Reply: no
```

Related topics

- "ping6" on page 655
- "traceroute" on page 670

reboot

Use this command to restart the FortiWeb appliance.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute reboot
```

Example

This example shows the reboot command in action.

```
execute reboot
```

The CLI displays the following:

```
This operation will reboot the system !
Do you want to continue? (y/n)
```

After you enter `y` (yes), the CLI displays the following:

```
System is rebooting...
```

If you are connected to the CLI through a local console, the CLI displays messages while the reboot is occurring.

If you are connected to the CLI through the network, the CLI will not display any notification while the reboot is occurring, as this occurs after the network interfaces have been shut down. Instead, you may notice that the connection is terminated. Time required by the reboot varies by many factors, such as whether or not hard disk verification is required, but may be several minutes.

Related topics

- "shutdown" on page 666

remove vmlicense

Use this command to remove a FortiWeb-VM license.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

For more information on FortiWeb-VM licenses, see the *FortiWeb-VM Install Guide*:

https://docs.fortinet.com/fortiweb/hardware

Syntax

```
execute remove vmlicense
```

Example

This example shows the remove command in action.

```
execute remove vmlicense
```

The CLI displays the following:

```
This operation will remove existing license!
Do you want to continue? (y/n)
```

After you enter `y` (yes), the CLI displays the following:

```
removing license ......
```

Related Topics

- "restore vmlicense" on page 665

restore cert-config

Use this command to restore certificates of a FortiWeb appliance from a TFTP server.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute restore cer-config <filename_str> <tftp_ipv4>[<password_str>]
```

Variable	Description	Default
`<filename_str>`	Enter the name of the file to be used for the backup file, such as `FortiWeb_backup.zip`.	No default.
`<tftp_ipv4>`	Enter the IP address of the TFTP server.	No default.
`[<password_str>]`	Enter a password to be used when decompressing the backup file. **Caution:** Remember the password or keep it in a secure location. You will be required to enter the same password when restoring an encrypted backup file. If you forget or lose the password, you won't be able to use that encrypted backup file.	No default.

Example

This example restores certificates of the FortiWeb appliance on a TFTP server at IP address `192.0.2.23`. The file is encrypted with the password `P@ssword1`.

```
execute restore cert-config tftp FortiWeb_backup.zip 192.0.2.23 P@ssword1
```

Related topics

- "restore config" on page 662

restore config

Use this command to restore the configuration from a configuration backup file on an TFTP server, or to install primary or backup firmware.

Back up the configuration before restoring the configuration. This command restores configuration changes only, and does not affect settings that remain at their default values. Default values may vary by firmware version. For backup commands, see "backup cli-config" on page 641 and "backup full-config" on page 642.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute restore config tftp <filename_str>  <tftp_ipv4> [<password_str>]
```

Variable	Description	Default
`<filename_str>`	Enter the name of the backup or firmware image file.	No default.
`<tftp_ipv4>`	Enter the IP address of the TFTP server.	No default.
`[<password_str>]`	Enter the password that was used to encrypt the backup file, if any. If you do not provide a password, the backup file must have been stored as a clear file with a `.zip` extension.	No default.

Example

This example downloads a configuration file named `backup.zip` from the TFTP server, `192.0.2.23`, to the FortiWeb appliance. The backup file was encrypted with the password `P@ssword1`.

```
execute restore config tftp backup.zip 192.0.2.23 P@ssword1
```

The FortiWeb appliance then applies the configuration backup and reboots.

Related topics

- "backup full-config" on page 642
- "restore config" on page 662
- "restore image" on page 663
- "restore secondary-image" on page 664

restore image

Use this command to install firmware on the primary partition and reboot.

Back up the configuration before installing new firmware. Installing new firmware can change default settings and reset settings that are incompatible with the new version. For backup commands, see "backup full-config" on page 642 and "backup cli-config" on page 641.

Unlike installing firmware via TFTP during a boot interrupt, installing firmware using this command will attempt to preserve settings and files, and not necessarily restore the FortiWeb appliance to its firmware/factory default configuration.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute restore image ftp <filename_str>  <ftp_ipv4>
execute restore image tftp <filename_str>  <tftp_ipv4>
```

Variable	Description	Default
`<filename_str>`	Enter the name of the firmware image file.	No default.
`<ftp_ipv4>`	Enter the IP address of the TFTP server.	No default.
`<tftp_ipv4>`	Enter the IP address of the FTP server.	No default.

Example

This example installs a firmware file named `firmware.out` from the TFTP server, `192.0.2.23`, to the FortiWeb appliance.

```
execute restore image tftp firmware.out 192.0.2.23
```

The FortiWeb appliance downloads the firmware file, installs it, and reboots.

Related topics

- "restore config" on page 662
- "restore secondary-image" on page 664
- "system flash" on page 630
- "system status" on page 675

restore secondary-image

Use this command to install backup firmware on the secondary partition and reboot.

Back up the configuration before installing new firmware. Installing new firmware can change default settings and reset settings that are incompatible with the new version. For backup commands, see "backup full-config" on page 642 and "backup cli-config" on page 641.

Unlike installing firmware via TFTP during a boot interrupt, installing firmware using this command will attempt to preserve settings and files, and not necessarily restore the FortiWeb appliance to its firmware/factory default configuration.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute restore secondary-image ftp <filename_str>  <ftp_ipv4>
execute restore secondary-image tftp <filename_str>  <tftp_ipv4>
```

Variable	Description	Default
`<filename_str>`	Enter the name of the firmware image file.	No default.
`<ftp_ipv4>`	Enter the IP address of the FTP server.	No default.
`<tftp_ipv4>`	Enter the IP address of the TFTP server.	No default.

Example

This example installs a firmware file named `firmware.out` from the TFTP server, `192.0.2.23`, to the FortiWeb appliance.

```
execute restore secondary-image tftp firmware.out 192.0.2.23
```

The FortiWeb appliance downloads the firmware file, installs it, and reboots.

Related topics

- "backup cli-config" on page 641

- "restore image" on page 663
- "system flash" on page 630
- "system status" on page 675

restore vmlicense

Use this command to upload a FortiWeb-VM license file from an FTP or TFTP server.

After you enter the command, FortiWeb prompts you to confirm the upload.

After the license is authenticated successfully, the following message is displayed:

```
"*ATTENTION*: license registration status changed to 'VALID', please logout and re-login"
```

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

For more information on FortiWeb-VM licenses, see the *FortiWeb-VM Install Guide*:

https://docs.fortinet.com/fortiweb/hardware

Syntax

```
execute restore vmlicense {ftp | tftp} "<license-file_str>" {"<ftp_ipv4>" | "<user_
    str>":"<password_str>"@"<ftp_ipv4>" | "<tftp_ipv4>"}
```

Variable	Description	Default
`{ftp | tftp}`	Specify whether to connect to the server using file transfer protocol (FTP) or trivial file transfer protocol (TFTP).	No default.
`"<license-file_str>"`	Enter the name of the license file.	No default.
`"<ftp_ipv4>"`	Enter the IP address of the FTP server.	No default.
`"<user_str>"`	Enter the user name that FortiWeb uses to authenticate with the server.	No default.
`"<password_str>"`	Enter the password for the account specified by <user_str>.	No default.
`"<tftp_ipv4>"`	Enter the IP address of the TFTP server.	No default.

Example

This example uploads the license file `FVVM040000010871.lic` from the TFTP server `192.0.2.23` to the FortiWeb appliance.

```
execute restore vmlicense tftp FVVM040000010871.lic 192.0.2.23
```

The FortiWeb appliance uploads the file, and then prompts you to log out and log in again.

session-cleanup

Use this command to immediately clean up all sessions.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute session-cleanup
```

shutdown

Use this command to prepare the FortiWeb appliance to be powered down by halting the software, clearing all buffers, and writing all cached data to disk.

Power off the FortiWeb appliance only after issuing this command. Unplugging or switching off the FortiWeb appliance without issuing this command could result in data loss.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute shutdown
```

Example

This example shows the reboot command in action.

```
execute shutdown
```

The CLI displays the following:

```
This operation will halt the system
(power-cycle needed to restart)!Do you want to continue? (y/n)
```

After you enter `y` (yes), the CLI displays the following:

```
System is shutting down...(power-cycle needed to restart)
```

If you are connected to the CLI through a local console, the CLI displays a message when the shutdown is complete.

If you are connected to the CLI through the network, the CLI will not display any notification when the shutdown is complete, as this occurs after the network interfaces have been shut down. Instead, you may notice that the connection times out.

Related topics

- "reboot" on page 659

telnet

Use this command to open a Telnet connection to a server using IPv4 to port 23.

Telnet connections are not secure. Eavesdroppers could easily obtain your administrator password. Only use telnet over a trusted, physically secured network, such as a direct connection between your computer and the appliance.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute telnet "<host_ipv4>"
```

Variable	Description	Default
`telnet "<host_ipv4>"`	Enter the IP address of the host.	No default.

Example

This example Telnets to a host with the IP address `192.0.2.10`.

```
execute telnet 192.0.2.10
login: admin
Password: *******
```

Related topics

- "telnettest" on page 668
- "ping" on page 653
- "ping6" on page 655

telnettest

Use this command to open a Telnet connection to a server using an IPv4 or IPv6 address or fully qualified domain name (FQDN). This command can be useful for troubleshooting. For example, when the server does not support the HTTP versions, methods, headers, and so on, that the client uses.

Telnet connections are not secure. Eavesdroppers could easily obtain your administrator password. Only use Telnet over a trusted, physically secured network, such as a direct connection between your computer and the appliance, and from the appliance to the server.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute telnettest {"<host_ipv4>" | "<host_ipv6>" | "<host_fqdn>"}
```

Variable	Description	Default
`telnettest {"<host_ipv4>" | "<host_ipv6>" | "<host_fqdn>"}`	Enter the IP address or fully qualified domain name (FQDN) of the host.	No default.

Example

This example Telnets to a host with the IPv4 address `192.0.2.10` on port 80, the IANA standard port for HTTP.

```
FortiWeb# exec telnettest 192.0.2.10:80
Connected

GET /

Entering interactive mode. Type CTRL-D to exit.
<!DOCTYPE HTML PUBLIC "-//IETF//DTD HTML 2.0//EN">

</head><body>
<h1>Method Not Implemented</h1>
<p>Get to /index.html not supported.<br />
</p>
<hr>
<address>Apache/2.2.22 (Unix) DAV/2 mod_ssl/2.2.22 OpenSSL/0.9.8x Server at irene.local Port
    80</address>
</body></html>
Connection closed.

Connection status to 192.0.2.10 port 80:
Connecting to remote host succeeded.
```

Related topics

- "telnet" on page 667
- "ping" on page 653
- "ping6" on page 655

time

Use this command to display or set the system time.

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute time [<time_str>]
```

Variable	Description	Default
`time [<time_str>]`	Enter the current date for the FortiWeb appliance's time zone, using the format `hh:mm:ss`, where: • `hh` is the hour. Valid hours are 00–23 • `mm` is the minute. Valid minutes are 00–59. • `ss` is the second. Valid seconds are 00–59. If you do not specify a time, the command returns the current system time. Shortened values, such as `1` instead of `01` for the hour, are valid. For example, you could enter either `01:01:01` or `1:1:1`.	No default.

Example

This example sets the system time to 15:31:03:

```
execute time 15:31:03
```

Related topics

- "date" on page 647

traceroute

Use this command to use ICMP to test the connection between the FortiWeb appliance and another network device, and display information about the time required for network hops between the device and the FortiWeb appliance.

To use this command, your administrator account's access control profile must have at least `r` permission to the `sysgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute traceroute {"<host_fqdn>" | "<host_ipv4>"}
```

Variable	Description	Default
`traceroute {"<host_fqdn>" | "<host_ipv4>"}`	Enter either the IP address or fully qualified domain name (FQDN) of the host.	No default.

Example

This example tests connectivity between the FortiWeb appliance and docs.fortinet.com. In this example, the trace times out after the first hop, indicating a possible connectivity problem at that point in the network.

```
FortiWeb# execute traceroute docs.fortinet.com
traceroute to docs.fortinet.com (65.39.139.196), 30 hops max, 38 byte packets
1  192.0.2.200 (192.0.2.200) 0.324 ms 0.427 ms 0.360 ms
 2  * * *
```

Example

This example tests the availability of a network route to the server example.com.

```
execute traceroute example.com
```

The CLI displays the following:

```
traceroute to example.com (192.168.1.10), 32 hops max, 72 byte packets
1 172.16.1.2  0 ms 0 ms 0 ms
2  10.10.10.1  <static.isp.example.net> 2 ms 1 ms 2 ms
3  10.20.20.1   1 ms  5 ms 1 ms
4  10.10.10.2  <core.isp.example.net> 171 ms 186 ms 14 ms
5  10.30.30.1  <isp2.example.net> 10 ms 11 ms 10 ms
6  10.40.40.1  73 ms 74 ms 75 ms
7 192.168.1.1  79 ms 77 ms 79 ms
8 192.168.1.2 73 ms 73 ms 79 ms
9 192.168.1.10 73 ms 73 ms 79 ms
10 192.168.1.10 73 ms 73 ms 79 ms
```

Example

This example attempts to test connectivity between the FortiWeb appliance and example.com. However, the FortiWeb appliance could not trace the route, because the primary or secondary DNS server that the FortiWeb appliance is

configured to query could not resolve the FQDN `example.com` into an IP address, and it therefore did not know to which IP address it should connect. As a result, an error message is displayed.

```
FortiWeb# execute traceroute example.com
traceroute: unknown host example.com
Command fail. Return code 1
```

To resolve the error message in order to perform connectivity testing, the administrator would first configure the FortiWeb appliance with the IP addresses of DNS servers that can resolve the FQDN `example.com`. For details, see "system dns" on page 237.

- "network sniffer" on page 621

update-now

Use this command to initiate an update of the predefined robots, data types, suspicious URLS, and attack signatures used by your FortiWeb appliance.

FortiWeb appliances receive updates from the FortiGuard Distribution Network (FDN). The FDN is a world-wide network of FortiGuard Distribution Servers (FDS). FortiWeb appliances connect to the FDN by connecting to the FDS nearest to the FortiWeb appliance by its configured time zone.

The time required for the update varies with the availability of the updates, the size of the updates, and the speed of the FortiWeb appliance's network connection. If event logging is enabled, and the FortiWeb appliance cannot connect successfully, it will log the message `update failed, failed to connect any fds servers!` or `FortiWeb is unauthorized`

To use this command, your administrator account's access control profile must have either `w` or `rw` permission to the `mntgrp` area. For details, see "Permissions" on page 55.

Syntax

```
execute update-now
```

get

The `get` command displays parts of your FortiWeb appliance's configuration in the form of a list of settings and their values.

Unlike `show`, `get` displays **all** settings, even if they are still in their default state.

For example, you might get the current DNS settings:

```
get system dns
primary : 192.0.2.19
secondary : 0.0.0.0
domain : example.com
```

Notice that the command displays the setting for the secondary DNS server, even though it has not been configured, or has reverted to its default value.

Also unlike `show`, unless used from within an object or table, `get` requires that you specify the object or table whose settings you want to display.

For example, at the root prompt, this command would be valid:

```
get system dns
```

and this command would **not** be valid:

```
get
```

Like `show`, depending on whether or not you have specified an object, `get` may display one of two different outputs, either the configuration that you have just entered but not yet saved, or as it currently exists on the flash disk.

For example, immediately after configuring the secondary DNS server setting but **before** saving it, `get` displays two different outputs (differences highlighted in bold):

```
FortiWeb# config system dns
FortiWeb (dns)# set secondary 192.0.2.10
FortiWeb (dns)# get
primary : 192.0.2.19
secondary : 192.0.2.10
domain : example.com
FortiWeb (dns)# get system dns
primary : 192.0.2.19
secondary : 0.0.0.0
domain : example.com
```

The first output from `get` indicates the value that you have configured but not yet saved; the second output from `get` indicates the value that was last saved to disk.

If you were to now enter `end`, saving your setting to disk, `get` output for both syntactical forms would again match. However, if you were to enter `abort` at this point and discard your recently entered secondary DNS setting instead of saving it to disk, the FortiWeb appliance's configuration would therefore match the second output, not the first.

If you have entered settings but cannot remember how they differ from the existing configuration, the two different forms of `get`, with and without the object name, can be a useful way to remind yourself.

Most `get` commands, such as `get system dns`, are used to display configured settings. You can find relevant information about such commands in the corresponding config commands in the `config` chapter.

Other `get` commands, such as `get system performance` (page 674), are used to display system information that is **not** configurable. This chapter describes this type of `get` command.

The get commands require at least read (r) permission to applicable administrator profile groups.

This section describes the following commands:

`system fortisandbox-statistics`	`system performance`	`system status` `waf signature-rules`

Although not explicitly shown in this section, for all `config` commands, there are related `get` and `show` commands which display that part of the configuration. `get` and `show` commands use the same syntax as their related `config` command, unless otherwise mentioned. For syntax examples and descriptions of each configuration object, field, and option, see "config " on page 69.

When ADOMs are enabled, if you log in as `admin`, the top level of the shell changes: the two top level items are `get global` and `get vdom`:

- `get global` displays settings that only `admin` or other accounts with the **prof_admin** access profile can change.
- `get vdom` displays each ADOM and its respective settings.

This menu and CLI structure change is not visible to non-global accounts; ADOM administrators' navigation menus continue to appear similar to when ADOMs are disabled, except that global settings such as network interfaces, HA, and other global settings do not appear.

system fortisandbox-statistics

Use this command to display a count of uploaded files that FortiSandbox has evaluated in the past seven days, by evaluation result.

FortiWeb organizes the statistics using the following categories:

- Detected (total malicious files detected)
- Clean
- Risk-low (total low-risk malicious files detected)
- Risk-medium (total medium-risk malicious files detected)
- Risk-high (total high-risk malicious files detected)

Syntax

```
get system fortisandbox-statistics
```

Example

```
FortiWeb # get system fortisandbox-statistics
detected : 0
clean : 0
risk-low : 0
risk-medium : 0
risk-high : 0
```

system performance

Displays the FortiWeb appliance's CPU usage, memory usage, average system load, and up time.

Normal idle load varies by hardware platform, firmware, and configured features. To determine your specific baseline for idle, configure your system completely, reboot, then view the system load. After at least 1 week of uptime with typical traffic volume, view the system load again to determine the normal non-idle baseline.

System load is the average of percentages relative to the maximum possible capability of this FortiWeb appliance's hardware. It includes:

- Average system load
- Number of HTTP daemon/proxy processes or children
- Memory usage
- Disk swap usage

Syntax

```
get system performance
```

Example

```
FortiWeb # get system performance
CPU states: 4% used, 96% idle
Memory states: 18% used
System Load: 1
Up: 28 days, 11 hours, 38 minutes
```

system status

Use this command to display system status information, including:

- FortiWeb firmware version, build number and date
- FortiWeb appliance serial number and boot loader (“Bios”) version
- Log hard disk availability
- Host name
- Operation mode, such as Reverse Proxy or Transparent Inspection
- Current HA status for all appliances in the HA cluster (if HA is enabled)

Syntax

```
get system status
```

Example

```
get system status
International Version:FortiWeb-1000C 5.01,build0039,130726
Serial-Number:FV-1KC3R11700094
Bios version:04000002
Log hard disk:Available
Hostname:FortiWeb
Operation Mode:Reverse Proxy
Current HA mode=active-passive, Status=main
HA member :
Serial-Number Priority HA-Role
FV-1KC3R11700136 5 standby
FV-1KC3R11700094 1 main
```

waf signature-rules

Use this command to list the IDs, names, and descriptions of signature rules.

You specify signatures in the `config waf signature` command using the signature ID only. This command allows you to view the names and descriptions of the IDs.

Syntax

```
get waf signature-rules
```

Example

```
get waf signature-rules
```

This example output is the first four entries that the CLI displays when FortiWeb is configured with the default signatures only.

```
rule id : 110000009
main class id : 110000000
main class name : Bad Robot
sub class id : 000000000
sub class name : Bad Robot
rule description : This signature prevents Google Skipfish scanner from exploiting a
    vulnerability to include an arbitrary remote file with malicious PHP code and executing
    it in the context of the webserver process.
This attack can be achieved in HTTP request arguments.

rule id : 110000010
main class id : 110000000
main class name : Bad Robot
sub class id : 000000000
sub class name : Bad Robot
rule description : This signature checks whether the request came from Google Skipfish Web
    scanner.
The signature check region: user-agent field in http request header.

rule id : 110000011
main class id : 110000000
main class name : Bad Robot
sub class id : 000000000
sub class name : Bad Robot
rule description : This signature checks whether the request contains a string of a content
    scraper, which could be a part of virus.
The signature check region: user-agent field in http request header.

rule id : 110000012
main class id : 110000000
main class name : Bad Robot
sub class id : 000000000
sub class name : Bad Robot
rule description : This signature checks whether the request came from Acunetix Web
    Vulnerability Scanner.
The signature check region: http request url.
```

show

The `show` command displays parts of your FortiWeb appliance's configuration in the form of commands that are required to achieve that configuration from the firmware's default state.

The `show` commands require at least read (r) permission to applicable administrator profile groups.

Although not explicitly shown in this section, for all `config` commands, there are related `get` and `show` commands which display that part of the configuration. `get` and `show` commands use the same syntax as their related `config` command, unless otherwise mentioned. For syntax examples and descriptions of each configuration object, field, and option, see "config " on page 69.

Unlike `get`, `show` does **not** display settings that are assumed to remain in their default state.

For example, you might show the current DNS settings:

```
FortiWeb# show system dns
config system dns
   set primary 172.16.1.10
   set domain "example.com"
end
```

Notice that the command does **not** display the setting for the secondary DNS server. This indicates that it has not been configured, or has reverted to its default value.

Like `get`, depending on whether or not you have specified an object, `show` may display one of two different outputs, either the configuration:

- that you have just entered but not yet saved, or
- as it currently exists on the flash disk, respectively.

For example, immediately after configuring the secondary DNS server setting but **before** saving it, `show` displays two different outputs (differences highlighted in bold):

```
FortiWeb# config system dns
FortiWeb (dns)# set secondary 192.168.1.10
FortiWeb (dns)# show
config system dns
   set primary 172.16.1.10
   set secondary 192.168.1.10
   set domain "example.com"
end
FortiWeb (end)# show system dns
config system dns
   set primary 172.16.1.10
   set domain "example.com"
end
```

The first output from `show` indicates the value that you have configured but not yet saved; the second output from `show` indicates the value that was last saved to disk.

If you have entered settings but cannot remember how they differ from the existing configuration, the two different forms of `show`, with and without the object name, can be a useful way to remind yourself.

If you were to now enter `end`, saving your setting to disk, `show` output for both syntactical forms would again match. However, if you were to enter `abort` at this point and discard your recently entered secondary DNS setting instead of saving it to disk, the FortiWeb appliance's configuration would therefore match the second output, not the first.

When ADOMs are enabled, and if you log in as `admin`, the top level of the shell changes: the two top level items are `show global` and `show vdom`.

- `show global` displays settings that only `admin` or other accounts with the **prof_admin** access profile can change.
- `show vdom` displays each ADOM and its respective settings.

This menu and CLI structure change is not visible to non-global accounts; ADOM administrators' navigation menus continue to appear similar to when ADOMs are disabled, except that global settings such as network interfaces, HA, and other global settings do not appear.
